Evolution by Natural Selection
Darwin's theory
Evolution in vitro
Lamark, Weismann, and the central dogma
Models of Population
Selection in an asexual population
The accuracy of replication
Genetic drift in finite populations
Evolution in Diploid Populations
Gene frequencies and the Hardy-Weinberg ratio
The concept of fitness
The spread of a favourable gene
The Variability of Natural Populations
The evidence for genetic variability
Mutation
The maintenance of variation
Evolution at More Than One Locus
Linkage disequilibrium
Heterostyly in plants
Mimicry in butterflies
Linkage disequilibrium in natural populations
Normalizing selection and linkage disequilibrium
Quantitative Genetics
Nature and nurture
The additive genetic model
A more realistic model
Experiments in artificial selection
Quantitative variation and fitness
The maintenance of genetic variance for quantitative traits
A Model of Phenotypic Evolution
Pairwise interactions
Some extensions of the model
Will a sexual population evolve to an ESS?
Finite and Structured Populations
Inbreeding
Genetic drift
The rate of neutral molecular evolution
Mitochondrial DNA
Migration and differentiation between populations
The establishment of a new favourable mutation
Evolution in Structured Populations
