“Stepping Stone” Model of Population
Process leading to quasi-fixation of genes in natural populations due to random
fluctuation of selection intensities
Solution of a process of random genetic drift with a continuous model
Stochastic processes and distribution of gene frequencies under natural selection

A model of a genetic system which leads to closer linkage by natural selection
Some problems of stochastic processes in genetics
On the change of population fitness by natural selection
Optimum mutation rate and degree of dominance as determined by the principle of minimum
genetic load
Natural selection as the process of accumulating genetic information in adaptive
evolution
The maintenance of supernumerary chromosomes in wild populations of _Lilium
callosum_ by preferential segregation
On the probability of fixation of mutant genes in a population
A probability method for treating inbreeding systems, especially with linked genes

On the maximum avoidance of inbreeding
The number of alleles that can be maintained in a finite population
The stepping stone model of population structure and the decrease of genetic
correlation with distance
Diffusion models in population genetics
A stochastic model concerning the maintenance of genetic variability in quantitative
characters
Attainment of quasi linkage equilibrium when gene frequencies are changing by natural
selection
Evolution in sexual and asexual populations
The mutational load with epistatic gene interactions in fitness
On the evolutionary adjustment of spontaneous mutation rates
Evolutionary rate at the molecular level
Genetic variability maintained in a finite population due to mutational production of
neutral and nearly neutral isoalleles
The average number of generations until fixation of a mutant gene in a finite population
25 The number of heterozygous nucleotide sites maintained in a finite population due to
steady flux of mutations
The rate of molecular evolution considered from the standpoint of population genetics

The length of time required for a selectively neutral mutant to reach fixation through
random frequency drift in a finite population
Development of associative overdominance through linkage disequilibrium in finite
populations
Protein polymorphism as a phase of molecular evolution
Linkage disequilibrium between two segregating nucleotide sites under the steady
flux of mutations in a finite population
Some methods for treating continuous stochastic processes in population genetics
Mutation and evolution at the molecular level
Eukaryotes-prodaryotes divergence estimated by 5S ribosomal RNA sequences

The age of a neutral mutant persisting in a finite population

A model of mutation appropriate to estimate the number of electrophoretically detectable alleles in a finite population

A note on the speed of gene frequency changes in reverse directions in a finite population

On some principles governing molecular evolution

Moments for sum of an arbitrary function of gene frequency along a stochastic path of gene frequency change

How genes evolve; a populations geneticist's view

Preponderance of synonymous changes as evidence for the neutral theory of molecular evolution

Change of gene frequencies by natural selection under population number regulation

Effect of overall phenotypic selection on genetic change at individual loci

Efficiency of truncation selection

Fixation of a deleterious allele at one of two "duplicate" loci by mutation pressure and random drift

Population genetics of multigene family with special reference to decrease of genetic correlation with distance between gene members on a chromosome

A simple method for estimating evolutionary rates of base substitutions through comparative studies of nucleotide sequences

Genetic variability and effective population size when local extinction and recolonization of subpopulations are frequent

Estimation of evolutionary distances between homologous nucleotide sequences

Possibility of extensive neutral evolution under stabilizing selection with special reference to nonrandom usage of synoncymous codons

A model of evolutionary base substitutions and its application with special reference to rapid change of pseudogenes

Selective constraint in protein polymorphism: Study of the effectively neutral mutation model by using an improved pseudosampling method

Diffusion model of intergroup selection, with special reference to evolution of altruistic character

Rare variant alleles in the light of the neutral theory

Diffusion models in population genetics with special reference to fixation time of molecular mutants under mutational pressure

DNA and the neutral theory

Molecular evolutionary clock and the neutral theory
