Foreword
Advisory Committee
Dedication
Keynote address
The Methane to Markets Partnership: Opportunities for coal mine methane utilization

Ventilation planning
Ventilation on demand: A preliminary study for Ballarat Goldfields NL
Justifying ventilation-on-demand in a Canadian mine and the need for process based simulations
Ventilation planning for mining of the Sarvisuo Lode in the Orivesi Mine
Ventilation upgrade of Minerales Monclova’s Mine 6
Transition of the Henderson Mine ventilation system to the new lower levels
Ventilation planning at Minerales Monclova’s Mine 7
Maximizing the ventilation of large-opening mines
Optimization of the Red Lake Mine ventilation system
Remote monitoring and automation of a large mine ventilation network
Underground mine ventilation planning, heat loads, and diesel equipment

Diesel emissions control
West Virginia diesel regulations: A model for the coal industry
Pennsylvania’s diesel equipment program for underground bituminous coal mines
An overview of the MSHA industrial hygiene laboratory
Instrumentation for diesel particulate matter emissions research
Measuring diesel particulate matter in underground mines using submicron elemental carbon as a surrogate
Emissions-based maintenance program
USA salt mines and DPM control strategies
An integrated approach for managing diesel emissions controls for underground metal mines
Implementation of diesel particulate filter technology in underground metal and nonmetal mines
Post-field evaluation of diesel particulate filters
DEEP project on evaluation of diesel particulate filters at Inco’s Stobie Mine
DPM reductions at underground metal and nonmetal mines using alternative fuels
The effects of water emulsified fuel on diesel particulate matter concentrations in underground mines

Mine dusts
Evaluation of a new real time personal dust meter for engineering studies
Evaluation of SKC Inc. Dust Detective
Comparison of three side-by-side real-time dust monitors in a duet using average and peak display dust levels as parameters of performance evaluation

Lowering respirable dust at an iron ore concentrator plant through improved ventilation practices
A new method to clean dust from soiled work clothes  p. 197
Impact of fan type for reducing respirable dust at an underground limestone crushing facility  p. 203
Emerging technologies control respirable dust exposures for continuous mining and roof bolting personnel  p. 211
A field demonstration of an innovative spray system on continuous miners for dust control  p. 217
Dust control on longwalls - assessment of the state-of-the-art  p. 225
A field demonstration of the JOY Wet-Head Miner technology  p. 233
Heat and humidity
Controlling heat loads from cemented mine backfill  p. 243
Thermo- and psychrometric properties of intake air passing through fragmented strata  p. 251
Controlling personnel heat exposure in Canada’s deep and highly mechanized mines  p. 259
Optimum insulation for engineering control of mine thermal regime around a mine airway in permafrost  p. 271
Design of energy efficient mine ventilation and cooling systems  p. 279
Integration of strategic ventilation and heat management planning with 3D virtual reality simulation of underground mines  p. 285
Alternative fog removal methods in mine ramps  p. 295
Mine fires
Reducing belt entry fires in underground coal mines  p. 303
Fire-extinguishing and explosion-suppression technology for a super-large and shallow working underground fire zone  p. 317
Correlation between methane and fire hazards in abandoned workings of longwall mining  p. 325
Sealing a recent United States coal mine longwall gob fire  p. 331
The successful recovery of the Dotiki Mine after a major mine fire  p. 337
First Mexican coal mine recovery after a mine fire, Esmeralda Mine  p. 343
Mine fire management, case study in Pongkor Gold Mine, PT Aneka Tambang Tbk., Indonesia  p. 347
Queensland mine emergency level exercises assisted by fire simulation  p. 351
Mine seals
Explosion evaluation of mine ventilation stoppings  p. 361
Evaluation of remotely installed mine seals for mine fire control  p. 367
Coalbed/coal mine methane
Prediction of longwall methane emissions and the associated consequences of increasing longwall face lengths: A case study in the Pittsburgh Coalbed  p. 375
Predicting methane emissions from longer longwall faces by analysis of emission contributors  p. 383
Effect of scrubber operation on airflow and methane patterns at the mining face  p. 393
Effect of water sprays on airflow movement and methane dilution at the working face  p. 401
Coal mine methane utilization options  p. 407
Methods and means of recovery and utilization of methane from mines | p. 413
VAM to electricity - 1st large-scale installation | p. 421
Development and application of reservoir models for the evaluation and optimization of longwall methane control systems | p. 425
Optimum widths of longwall panels in highly gassy mines - Part 1 | p. 433
Methane and methane control in Chinese coal mines | p. 439
Modern CMM drainage strategies | p. 449
Cross-linked polymer gel seals horizontal degas boreholes greater than 4,000 feet long | p. 455
Target Drilling’s long boreholes maximize longwall dimensions | p. 463
Sinking a 990 m surface borehole for methane drainage of a longwall panel in a UK coal mine | p. 469

Numerical modeling
Ventilation simulation programs MineVent and MFIRE: Updates to advance the technology of simulation programming | p. 477
Fire-generated smoke rollback through crosscut from return to intake - experimental and CFD study | p. 483
Case study of CFD simulation in mining accident investigation | p. 491

Mine gases
Hydrogen sulfide control on a longwall face | p. 499
Early detection of flammable gas danger in hard rock mines to protect miners | p. 503
CO dispersion from a coal fire in a mine entry | p. 511
The application of open path infra-red detectors in underground coal mines | p. 519

Mine fans
Selection of mixed-flow fans for PT Freeport’s DOZ Mine, West Papua, Indonesia | p. 527
Fan selection for large-opening mines: Vane-axial or propeller fans - which to choose? | p. 535

Design and operational aspects in the use of booster, circuit and auxiliary fan systems | p. 543

Recirculation in the potash mines of Saskatchewan | p. 555
Blind shaft drilling as a safer alternative to conventional sinking | p. 559

Mine stoppings
Stoppings: Technology developments and mine safety engineering evaluations | p. 565
Development of new protocols to evaluate the transverse loading of mine ventilation stoppings | p. 569
Novel stopping designs for large-opening metal/nonmetal mines | p. 579

Leakage and gob flows
Ventilation surveying and modeling of longwall bleeder and gob areas | p. 587
Computational fluid dynamics study on the ventilation flow paths in longwall gobs | p. 591

Study of leakage flow in US underground coal mines | p. 599

Ventilation education and training
Developments in mine ventilation legislation, statutory qualifications and ventilation training in Australia | p. 609
Ventilation education and training | p. 619
