Foreword
Preface
Introduction
Constant Envelope Modulations
The Need for Constant Envelope
Quadriphase-Shift-Keying and Offset (Staggered) Quadriphase-Shift-Keying
Differentially Encoded QPSK and Offset (Staggered) QPSK
[phi]/4-QPSK: A Variation of Differentially Encoded QPSK with Instantaneous Amplitude Fluctuation Halfway between That of QPSK and OQPSK
Power Spectral Density Considerations
Ideal Receiver Performance
Performance in the Presence of Nonideal Transmitters
Modulator Imbalance and Amplifier Nonlinearity
Data Imbalance
Continuous Phase Modulation
Full Response--MSK and SFSK
Partial Response--Gaussian MSK
Simulation Performance
References
Quasi-Constant Envelope Modulations
Brief Review of IJF-QPSK and SQORC and their Relation to FQPSK
A Symbol-by-Symbol Cross-Correlator Mapping for FQPSK
Enhanced FQPSK
Interpretation of FQPSK as a Trellis-Coded Modulation
Optimum Detection
Suboptimum Detection
Symbol-by-Symbol Detection
Average Bit-Error Probability Performance
Further Receiver Simplifications and FQPSK-B Performance
Cross-Correlated Trellis-Coded Quadrature Modulation
Description of the Transmitter
Specific Embodiments
Other Techniques
Shaped Offset QPSK
References
Bandwidth-Efficient Modulations with More Envelope Fluctuation
Bandwidth-Efficient TCM with Prescribed Decoding Delay--Equal Signal Energies
ISI-Based Transmitter Implementation
Evaluation of the Power Spectral Density
Optimizing the Bandwidth Efficiency
Bandwidth-Efficient TCM with Prescribed Decoding Delay--Unequal Signal Energies
