Chairman's opening remarks
Design and synthesis of antimicrobial peptides
Gene-encoded antibiotics made in bacteria
General discussion I: Assaying antimicrobial activity
Biosynthesis of defensins and other antimicrobial peptides
Antimicrobial peptides from amphibian skin: an overview
Gene-encoded antimicrobial peptides from plants
Drosophila as a model system for antibacterial peptides
Function of antimicrobial proteins in insects
General discussion II: Antimicrobial peptides from bees
Antibacterial peptides in insect vectors of tropical parasitic disease
Structure-function relationships of tachyplesins and their analogues
Bactericidal permeability-increasing protein in host defence against Gram-negative bacteria and endotoxin
General discussion III
Mechanism of membrane permeation by cecropin B2
Potential therapeutic applications of magainins and other antimicrobial agents of animal origin
Primitive vertebrate immunity: what is the evolutionary derivation of molecules that define the adaptive immune system?
Antimicrobial proteins with homology to serine proteases
Antimicrobial peptides as agents of mucosal immunity
Closing remarks
