

V Early phases in the reception of Newton's theory

The vortex theory in competition with Newtonian celestial dynamics

The shape of the Earth

Clairaut and the motion of the lunar apse: The inverse-square law undergoes a test

The precession of the equinoxes from Newton to d'Alembert and Euler

The solar tables of Lacaille and the lunar tables of Mayer

Predicting the mid-eighteenth-century return of Halley's Comet

The problem of perturbation analytically treated: Euler, Clairaut, d'Alembert

The work of Lagrange in celestial mechanics

Laplace

Measuring solar parallax: The Venus transits of 1761 and 1769 and their nineteenth-century sequels

The discovery of Uranus, the Titius-Bode and the asteroids

Eighteenth- and nineteenth-century developments in the theory and practice of orbit determination

The introduction of statistical reasoning into astronomy: from Newton to Poincaré. 27. Astronomy and the theory of errors: from the method of averages to the method of least squares

The golden age of celestial mechanics

Three centuries of lunar and planetary ephemerides and tables
