Oxygen and the History of Life
The Cell's Oxygen Sink and Energetics Getting Oxygen to the Sink Evolution of O2 Transport Systems Evolution of External Gas Exchangers Looking at the System as a Whole: Philosophy of the Approach
The Body's Need for Oxygen
Levels of O2 Consumption Estimating the Limits of O2 Consumption
Linking Structure and Function: Model, Means, and Tools
How Does Structure Affect O2 Flow?
Are Animals Built Reasonably?
The Tools
Cell Respiration
Gaining Energy from Combustion Metabolic Pathways of the Cell
The Cell's Energetic Balance Sheet
Mitochondria: the Cell's Furnaces
Putting Some Order into Cell Metabolism Oxidation-Phosphorylation Coupling
Depends on Structure Mitochondria and the Cell's Aerobic Potential Mitochondria in Muscle Cells
The Vehicle for Oxygen Transport: Blood and Circulation
The O2 and CO, Carrier: Blood Moving Blood Around: Circulation O2 Transport by the Blood

Delivering Oxygen to the Cells
Distributing Blood to the Tissues: Design of the Vasculature
The Microvascular Unit O2 Flow from Blood to Cells
Design and Development of the Mammalian Lung
Development of the Lung
Lung Histogenesis: Differentiation toward Gas Exchange
The Lung at Birth and Its Postnatal Maturation
Lung Cell Biology
Organization of the Lung's Cell Population A Closer Look at the Cells of the Gas Exchange Region
Airways and Blood Vessels
The Airway Tree Ventilation
The Vascular Trees Pulmonary Blood Flow Ventilation-Perfusion Matching
The Lung's Mechanical Support
External Support and Motive Force The Pleural Cavity
The Lung's Fiber Skeleton Surface Tension
Micromechanics and the Configuration of the Alveolar Septum
Keeping the Barrier Dry and Thin
The Lung as Gas Exchanger
Design of the Gas Exchanger Physiological Basis for Gas Exchange Pulmonary Diffusing Capacity
Physiology Pulmonary Diffusing Capacity
