DoD towards software services

Challenges for critical embedded systems

A role-based access control policy verification framework for real-time systems

Enhancing DNS security using the SSL trust infrastructure

An adaptable security framework for service-based systems

An RBAC framework for time constrained secure interoperation in multi-domain environments

Issues in providing quality of service in a joint battlespace infosphere

A real-time distributed scheduling service for middleware systems

Concurrency control on distributed objects using role ordering (RO) scheduler

Deterministic scheduling for multithreaded replicas

Improving the real-time behaviour of a multithreaded Java microcontroller by control theory and model based latency prediction

Development of the warfighting architecture requirements (war) tool

JavaMaC and runtime monitoring for geoinformatics grid services

Error recovery for a boiler system with OTS PID controller

Real-time data fusion technique for validation of an autonomous system

Distributed computing based streaming and play of music ensemble realized through TMO programming

Specification-based verification and validation of Web services and service-oriented operating systems

Evaluation of fault-tolerant distributed Web systems

Agent-oriented modelling and specification of Web services

A multi-granularity energy profiling approach and a quantitative study of a Web browser

An ontology-based approach for determining the dependability of service-oriented architectures

Progressive ranking and composition of Web services using covering arrays

A trustworthy Web services framework for business processes integration

Specification, analysis and implementation of architectural patterns for dependable software systems

Experiments with WCET-oriented programming and the single-path architecture

Operating systems for building robust embedded systems

A framework for simplifying the development of kernel schedulers : design and performance evaluation

A framework for middleware supporting real-time wide-area distributed computing

Virtual networks in an integrated time-triggered architecture

A graph-based model for component-based software development

Empirical assessment of machine learning based software defect prediction techniques

Reliable monitoring of network-related performance parameters in wireless environments

Object-based commutativity analysis for real-time applications

Towards a flow analysis for embedded system C programs
A transformational overview of the core functionality of an abstract class loader for the SSP  p. 301
Model-based integration of safety analysis and reliable software development  p. 312
Towards a dependable component technology for embedded system applications  p. 320
Design and implementation of fault-tolerant transactional agents for manipulating distributed objects  p. 329
Towards self-healing systems via dependable architecture and reflective middleware  p. 337
Dynamic reconfiguration of component-based real-time software  p. 347
On constructing overlay networks to support distributed real-time virtual environment applications  p. 355
Delay analysis for statistical real-time channels in mobile ad hoc networks  p. 363
Autonomous agents and anticipative systems  p. 371
Design exploration in Hw/Sw co-design of real-time object-oriented embedded systems: the scheduler object  p. 378
An FPGA-based key-store for improving the dependability of security services  p. 389
Distributed scalable location data management system based on the GALIS architecture  p. 397
A framework for preparing experimental evaluation of rerouting mechanisms  p. 405
Functional and non-functional properties in a family of embedded operating systems  p. 413
