Specialising in software engineering
Evaluating product line architectures: methods and techniques
The problem frames approach to software engineering
Aligning the map requirements modelling with the B-method for formal software development
A methodological framework for SysML: a problem frames-based approach
Extraction of viewpoints for eliciting customer’s requirements based on analysis of specification change records
Using genetic algorithms to aid test-data generation for data-flow coverage
Finding a test order using object-oriented slicing technique
Function call flow based fitness function design in evolutionary testing
Secure behavior of Web browsers to prevent information leakages
Realizability of collaboration-based service specifications
The validation and verification of WSCDL
Figure out the current software requirements engineering - what practitioners expect to requirements engineering?
A method for early requirements triage and selection utilizing product strategies

Enterprise assets security requirements construction from ESRMG grammar based on security patterns
Construction method of a high-order Markov chain usage model
Static call graph generator for C++ using debugging information
Improving data integrity with a Java mutability analysis
Field escape analysis for data confidentiality in Java components
Coordination-policy based composed system behavior derivation
Approximation algorithms for software component selection problem
Towards instant automatic model refinement based on OCL
Modeling and learning interaction-based accidents for safety-critical software systems
Conformance checking of running programs in dynamic aspect-oriented systems
Toward efficient aspect mining for Linux
Using B to verify the weaving of aspects
E-AoSAS++ and its software development environment
Visualization for software evolution based on logical coupling and module coupling

Optimising project feature weights for analogy-based software cost estimation using the Mantel correlation
An empirical study of class sizes for large Java systems
Are size measures better than expert judgement? : an industrial case study on requirements volatility
A middleware-based approach to model refactoring at runtime
Applying a code clone detection method to domain analysis of device drivers
Simultaneous modification support based on code clone analysis
Incentive compatible mechanisms for group ticket allocation in software maintenance services  
Statechart-based verification of object-oriented design models  
Compositional verification of UML dynamic models  
Requirements engineering for reactive systems: coloured Petri nets for an elevator controller  
An executable UML with OCL-based action semantics language  
Injecting security as aspectable NFR into software architecture  
An investigation into concurrency control mechanisms in data service layers  
Enhancing the ESIM (embedded systems improving method) by combining information flow diagram with analysis matrix for efficient analysis of unexpected obstacles in embedded software  
Developing an insulin pump system using the SOFL method  
Aspect-oriented modeling for embedded software design  
Automatic extraction and verification of page transitions in a Web application  
Disk-based software verification via bounded model checking  
A synchronization flow analysis of concurrent objects in AIBO OPEN-R programs based on communicating processes  
A process pattern language for agile methods  
Deriving software process simulation model from SPEM-based software process model  
Definition of an executable SPEM 2.0  
Experiment-driven approach to building support for distributed agile teams  
An approach to probabilistic effort estimation for military avionics software maintenance by considering structural characteristics  
A large-scale empirical comparison of object-oriented cohesion metrics  
An approach for specifying access control policy in J2EE applications  
Early validation and verification of a distributed role-based access control model  
Reducing unnecessary conservativeness in access rights analysis with string analysis  
A Six Sigma framework for software process improvements and its implementation  
Methodology support for the model driven architecture  
Use of agile methods and practices in the Philippines  
A survey on the business relationship between Chinese outsourcing software suppliers and their outsourcers  
Identifying key requirements for a new product line  
Tailoring the domain engineering process of the PLUS method  
Deriving product line requirements: the RED-PL guidance approach  
ezContract: using Marker library and Bytecode instrumentation to support design by contract in Java  
MKtrace: an innovative debugging tool for multi-threaded programs on multiprocessor systems  
Checking distributed programs with partially ordered atoms  
Quantitative analysis of value-based software processes using decision-based stochastic object Petri-nets
Improving effort estimation accuracy by weighted grey relational analysis during software development  
P. 534

A novel approach of prioritizing use case scenarios  
P. 542

W1 : workshop on accountability and traceability in global software engineering (ATGSE2007)  
P. 553

W2 : first international workshop on management and economics of software product lines (MESPUL)  
P. 555

W3 : 1st international workshop on software patterns and quality (SPAQu'07)  
P. 557

W4 : workshop on service oriented architecture  
P. 559

W5 : education workshop : bridging the university/industry gap  
P. 560

W6 : the first international workshop on software productivity analysis and cost estimation (SPACE'07)  
P. 562

Robust and flexible software inspection model for software re-engineering process : abstraction phase  
P. 565

Architectural naming, a secret of agile thinking  
P. 565

Time-quality metric model for quality measurement of Web-based systems  
P. 566

Analyzing the service level of software debugging system through simulation-based queuing approach  
P. 566

Distributed collaborative modeling support system for UML diagrams  
P. 567

The TASM language and the Hi-Five framework : specification, validation, and verification of embedded real-time systems  
P. 567

UCSI : towards a user-centric service integration approach  
P. 568

Formal model-driven engineering of distributed simulation systems based on architecture-centric domain-specific approach  
P. 568

DFTL : a description language for transformation of data formats  
P. 569

Email and trouble report analysis for revealing context with the project replayer  
P. 569

PORD : a reversible debugging tool using dynamic binary translation  
P. 570

Non-functional requirements elicitation and incorporation into functional models  
P. 570

Validating software reliability by binary translation  
P. 570

Project management practices on building management information system in IBM global business service  
P. 571

MEtaGile : an agile domain-specific modeling environment  
P. 571

Analysis of the factors of influencing parent's confidence on the Internet by associating rules mining  
P. 572
