Editorial
Quantitation of microbial metabolism
Quantifying heterogeneity: flow cytometry of bacterial cultures
Microbial growth dynamics on the basis of individual budgets
Quantitative aspects of cellular turnover
Quantitative approaches to the analysis of the control and regulation of microbial metabolism
Quantification of control of microbial metabolism by substrates and enzymes
On multiple-nutrient-limited growth of microorganisms, with special reference to dual limitation by carbon and nitrogen substrates
A new thermodynamically based correlation of chemotrophic biomass yields
The use of stoichiometric relations for the description and analysis of microbial cultures
Application of a metabolic balancing technique to the analysis of microbial fermentation data
Metabolite production and growth efficiency
Determination of the maximum product yield from glucoamylase-producing Aspergillus niger grown in the recycling fermentor
Physiology of yeasts in relation to biomass yields
Formation of fermentation products and extracellular protease during anaerobic growth of Bacillus licheniformis in chemostat and batch-culture
Quantitative aspects of glucose metabolism by Escherichia coli B/r, grown in the presence of pyrroloquinoline quinone
