Bistatic scattering by a spherical dielectric target illuminated by an electromagnetic pulse

Joint range-angle beamforming with application to estimation of target density functions

Frequency-domain texture features for classifying SAR images

Fractal detection algorithm for a LADAR sensor

Refinement of range-Doppler imagery by feedback control

Choice of an entropy-like function for range-Doppler processing

Principles and evaluation of an automatic target recognition system for synthetic aperture radar imagery based on the use of functional templates

Invariant phase-only filters for TABILS24 millimeter-wavelength radar data

Hypothesis likelihood function estimation for synthetic aperture radar targets

Target classification using wavelet decomposition features

Vector quantization and learning vector quantization for radar target classification

Full-polarization two-dimensional Prony modeling with application to radar target identification

Accuracy and computational comparisons of TLS-Prony, Burg, and FFT-based scattering center extraction algorithms

Reflectivity models for radar target recognition

Automatic target recognition using a photograph

Temporal syntax-guided object and intent recognition

Neural network filter for target detection in high-clutter imagery

Development of distortion-invariant texture operators

Experiments in the use of fractal in computer pattern recognition

Probabilistic IR modeling for Bayesian automatic object recognition

Joint transform correlation under varying illumination conditions of the target

Wavelets for training a neural network to recognize objects

Information-theoretic performance bounding of Bayesian identifiers

Method of lines for EM wave scattering from an arbitrary profile

Oscillatory neural networks for nonlinear system identification

New fast algorithm of 2D moment invariant based on projection

Exact-scattered-field generation for time-domain approach of ultrasound tomography

Data acquisition for knowledge-based image classification and interpretation of remotely sensed multispectral images

Resonance sonar identification of submerged shells that have oscillating internal masses attached by springs

Ocean acoustic source localization via Bayesian inversion

Holographic analysis of near-field acoustic displacement patterns of operating sonar transducer arrays

History of resonance scattering theory in acoustics and its applications to target recognition

Analysis and representation of sonar echo returns
| Proper fluid loading of thin shell theories and the prediction of pseudo-Stoneley resonances | p. 372 |
| Influence of a waveguide on backscattered signals in the far field | p. 384 |
| Decomposition of guided waves into spherical representations and near-field effects on target scattering | p. 394 |
| Classification of elastic-shell resonances on curved bounded surfaces to very high frequencies | p. 405 |
| Scattering from elastic shells near an interface and the concept of a super resonance | p. 413 |
| Classical scattering theory of waves from the viewpoint of an eigenvalue problem and application to target identification | p. 425 |
| Analytical method in image correlation | p. 436 |
| Natural-textured-object recognition using spatial matched filtering technique | p. 446 |
| Edge detectors and spectral image factorization | p. 450 |
| Iconic system for object recognition and its location determination | p. 466 |
| Probabilistic and information characteristics of iconic systems | p. 475 |
| Invariance considerations in design of image-formation-measurement computer systems | p. 483 |
