Imaging and the new biology: what's wrong with this picture?

Reader, error, object recognition, and visual search p. 1

Efficient channels for the ideal observer p. 12

Using Fisher information to compute ideal-observer performance on detection tasks p. 22

The effect of nonlinear human visual system components on linear model observers p. 31

Metrics of medical image quality: task-based model observers vs. image discrimination/perceptual difference models p. 42

Predicting detection task performance using a visual discrimination model p. 53

2-AFC observer study of shape and contrast discrimination in digital stereomammography p. 62

Salient features in mammograms using Gabor filters and clustering p. 72

Effect of independent multiple reading of mammograms on detection performance p. 82

Categories of observer error from eye tracking and AFROC data p. 90

Attentional perceptual thresholds for manipulated digitized mammograms p. 100

Modeling visual search during mammogram viewing p. 110

What can spatial frequency analysis tell us about inter-observer variability in mammogram reading? p. 116

Pulmonary nodule detection: what features attract attention? p. 122

Hypervolume under the ROC hypersurface of a near-guessing ideal observer in a three-class classification task p. 128

Problems with the differential receiver operating characteristic (DROC) method p. 138

Jackknife free-response ROC methodology p. 144

Evaluation of image analysis techniques without requiring ground truth or gold standard p. 154

Human efficiency in the detection and discrimination tasks p. 166

Gold standards and expert panels: a pulmonary nodule case study with challenges and solutions p. 173

Computer-aided detection of lung cancer on chest radiographs: effect of machine CAD true positive/false negative detections on radiologists' confidence level p. 185

Observers' ability to judge the similarity of clustered calcifications on mammograms p. 192

Use of BI-RADS lesion descriptors in computer-aided diagnosis of malignant and benign breast lesions p. 199

Comparison of nodule characteristics on CT and radiographic images p. 203

Classification of breast abnormalities under different detection cueing environments p. 211

Closed-form quality measures for compressed medical images: compression noise statistics of transform coding p. 218

Relative impact of detector noise and anatomical structure on lung nodule detection p. 230

Characterization of breast masses for simulation purposes p. 242

Comparison of two methods for evaluation of image quality of lumbar spine radiographs p. 251

Depth perception of stereo overlays in image-guided surgery p. 263
Fast approach to evaluate MAP reconstruction for lesion detection and localization p. 273

Quantitative image quality evaluation of spiral MRI techniques under noisy conditions p. 283

Using LROC analysis to evaluate detection accuracy of microcalcification clusters imaged with flat-panel CT mammography p. 293

Simulation study comparing the imaging performance of a solid state detector with a rotating slit collimator versus parallel beam collimator setups p. 301

Optimization of detector pixel size for stent visualization in x-ray fluoroscopy p. 311

Observer models and human visual detection performance with different targets p. 319

Calcification classifications of small nodules identified during CT lung cancer screening p. 330

AUC-based resolution in optical coherence tomography p. 334

2AFC assessment of contrast threshold for a standardized target using a monochrome LCD monitor p. 344

Distances between greyvalue curves p. 353

How does the concentration of iodine in enhancing lesions relate to image quality in head CT? p. 360

How do radiographic techniques affect mass lesion detection performance in digital mammography? p. 372

The effect of novel prompts upon radiologists’ visual search of mammograms p. 391

Breast screening technologists: does real-life case volume affect performance? p. 399

Detection of single cells: an observer study p. 407

Subjective assessment of high-level image compression of digitized mammograms p. 415

Use of a human visual system model to predict the effects of display veiling glare on observer performance p. 423

A prospective study of CAD system for lung cancer based on helical CT image analysis p. 430

Analysis of ROC on chest direct digital radiography (DR) after image processing in diagnosis of SARS p. 438

Full width at half maximum as a measure of vessel diameter in computed tomography angiography p. 447

Diagnostic performance of different measurement methods for lung nodule enhancement at quantitative contrast-enhanced computed tomography p. 455

Only stereo information improves performance in surgical tasks p. 463

Computer-assisted detection (CAD) of pulmonary nodules on thoracic CT scans using image processing and classification techniques p. 471

Semi-automated measurement of anatomical structures using statistical and morphological priors p. 476

A practical automated polyp detection scheme for CT colonography p. 487

Methods of evaluating the effectiveness of double-checking in interpreting mass screening images p. 496

LROC model observers for emission tomographic reconstruction p. 509

Reliability measure for segmenting algorithms p. 521
