Table of Contents

Preface p. 97
The contribution of RNAs and retroposition to evolutionary novelties p. 99
The emergence of a synthetic theory of intron evolution p. 117
Introns in gene evolution p. 123
Functional divergence in protein (family) sequence evolution p. 133
The EBG system of E. coli: Origin and evolution of a novel [beta]-galactosidase for the metabolism of lactose p. 143
The fucosyltransferase gene family: An amazing summary of the underlying mechanisms of gene evolution p. 157
Origin of new genes: Evidence from experimental and computational analyses p. 171
Transposable elements and vertebrate protein diversity p. 183
Birth of 'human-specific' genes during primate evolution p. 193
Evolution by gene duplication revisited: Differentiation of regulatory elements versus proteins p. 209
Modular assembly of genes and the evolution of new functions p. 217
Origin and evolution of a new gene expressed in the Drosophila sperm axoneme p. 233
Molecular mechanisms of exon shuffling: Illegitimate recombination p. 245
Recent evidence for the Exon Theory of Genes p. 251
The universe of exons revisited p. 267
Population-genetic models of the fates of duplicate genes p. 279
