Preface

Current Problems of Computer Analysis of Genetic Texts

Complexity Profiles of Genetic Texts

Base-Pair Selection in Specific Protein Binding Sites on DNA; A Statistical-Mechanical Model

Prediction of Protein-Coding Regions Interrupted by Introns

Computer Investigation of Structural Organization and Evolution of Functional Sites in Polynucleotide Sequences

Intelligent System of Mutational Analysis

Revealing of Complicated Structural-Functional Organization of Genetic Signals

Similarity Search in Biological Sequences

Local Parallel Analysis of Nucleotide Sequences

Determining Global Helical Parameters in Duplexed DNA

Electrostatics of DNA. New Dipole Model

Statistical Analysis of Dinucleotide Compositions and Its Application to the Identification of Coding Regions

The Increasing of Informational Content of the Protein Database

Molecular-Genetic Database and Software Development in the Soviet Union. The Problem of Database Integration

"Context" Package of Computer Programs for Analysis of DNA, RNA and Protein Sequences. Searching for Sequence Similarities and Functional Sites

"DNA-SUN" - A Powerful Computer Tool for DNA and Protein Analysis

The Escherichia Coli K12 Genome: Database and Data Analysis

Genbee: A Package of Computer Programs for Biopolymer Sequence Analysis

Flexis: Systems for Management of Integrated and Inquiry-Education Databases

Graphical Representation of DNA and Amino Acid Sequences

DNA Physical Mapping and Discrete Optimization

A Software System for the Assembly, Manipulation, and Visualization of Digitally Simulated Chromosomes

Computer Support of Electrophoretic Experiment

Application of Conformational Search to Antibody Modeling

From the Comparative Analysis of Proteins to Similarity-Based Modelling

Conformation of Triple Helix of Collagen as a Function of Primary Structure

Protein Design and Secondary Structure Prediction

Computer Analysis of Protein Tertiary Structure: Residue-Residue Approach

Interaction of Peptide and Protein Molecules with Lipophilic Environment Computer Modelling

Prediction of Protein Tertiary Structure by Analogy - Modelling of Loop Regions

Biological Adequacy of Protein Sequence Alignments

Distance Geometry and the Calculation of Protein Conformation

Computer System of Protein Structure and Function Predictions

Protein Secondary Structure Calculation on the Base of Discriminant Analysis with the Use of Information on Homologous Protein Structure
