Integrated protein interaction networks for 11 microbes p. 1
Hypergraph model of multi-residue interactions in proteins: sequentially-constrained partitioning algorithms for optimization of site-directed protein recombination p. 15
Biological networks: comparison, conservation, and evolutionary trees p. 30
Assessing significance of connectivity and conservation in protein interaction networks p. 45
Clustering short gene expression profiles p. 60
A patient-gene model for temporal expression profiles in clinical studies p. 69
Global interaction networks probed by mass spectrometry p. 83
Statistical evaluation of genome rearrangement p. 84
An improved statistic for detecting over-represented gene ontology annotations in gene sets p. 85
Protein function annotation based on ortholog clusters extracted from incomplete genomes using combinatorial optimization p. 99
Detecting MicroRNA targets by linking sequence, MicroRNA and gene expression data p. 114
RNA secondary structure prediction via energy density minimization p. 130
Structural alignment of pseudoknotted RNA p. 143
Stan Ulam and computational biology p. 159
CONTRAAlign: discriminative training for protein sequence alignment p. 160
Clustering near-identical sequences for fast homology search p. 175
New methods for detecting lineage-specific selection p. 190
A probabilistic model for gene content evolution with duplication, loss, and horizontal transfer p. 206
A sublinear-time randomized approximation scheme for the Robinson-Foulds metric p. 221
Algorithms to distinguish the role of gene-conversion from single-crossover recombination in the derivation of SNP sequences in populations p. 231
Inferring common origins from mtDNA p. 246
Efficient enumeration of phylogenetically informative substrings p. 248
Phylogenetic profiling of insertions and deletions in vertebrate genomes p. 265
Maximal accurate forests from distance matrices p. 281
Leveraging information across HLA alleles/supertypes improves epitope prediction p. 296
Improving prediction of zinc binding sites by modeling the linkage between residues close in sequence p. 309
An important connection between network motifs and parsimony models p. 321
Ultraconserved elements, living fossil transposons, and rapid bursts of change: reconstructing the uneven evolutionary history of the human genome p. 336
Permutation filtering: a novel concept for significance analysis of large-scale genomic data p. 338
Genome-wide discovery of modulators of transcriptional interactions in human B lymphocytes p. 348
A new approach to protein identification p. 363
Markov methods for hierarchical coarse-graining of large protein dynamics p. 379
Simulating protein motions with rigidity analysis p. 394
Predicting experimental quantities in protein folding kinetics using stochastic roadmap simulation  p. 410
An outsider's view of the genome  p. 425
Alignment statistics for long-range correlated genomic sequences  p. 426
Simple and fast inverse alignment  p. 441
Revealing the proteome complexity by mass spectrometry  p. 456
Motif Yggdrasil : samplig from a tree mixture model  p. 458
A study of accessible motifs and RNA folding complexity  p. 473
A parameterized algorithm for protein structure alignment  p. 488
Geometric sieving : automated distributed optimization of 3D motifs for protein function prediction  p. 500
A branch-and-reduce algorithm for the contact map overlap problem  p. 516
A novel minimized dead-end elimination criterion and its application to protein redesign in a hybrid scoring and search algorithm for computing partition functions over molecular ensembles  p. 530
10 years of the international conference on research in computational molecular biology (RECOMB)  p. 546
Sorting by weighted reversals, transpositions, and inverted transpositions  p. 563
A parsimony approach to genome-wide ortholog assignment  p. 578
Detecting the dependent evolution of biosequences  p. 595
