The logical way to be artificially intelligent p. 1
Ability in a multi-agent context: a model in the situation calculus p. 23
Reasoning about epistemic states of agents by modal logic programming p. 37
Strongly complete axiomatizations of "knowing at most" in syntactic structures p. 57
Logical spaces in multi-agent only knowing systems p. 77
Trustworthiness by default p. 96
Decision procedure for a fragment of mutual belief logic with quantified agent variables p. 112
Implementing temporal logics: tools for execution and proof p. 129
BDI agent programming in AgentSpeak using Jason p. 143
Using the KGP model of agency to design applications p. 165
Multi-threaded communicating agents in Qu-prolog p. 186
Variety of behaviours through profiles in logic-based agents p. 206
Contract-related agents p. 226
Specification and verification of agent interaction using abductive reasoning p. 243
Verification of protocol conformance and agent interoperability p. 265
Contextual terminologies p. 284
Constitutive norms in the design of normative multiagent systems p. 303
Combining answer sets of nonmonotonic logic programs p. 320
Speculative constraint processing with iterative revision for disjunctive answers p. 340
Intention recognition in the situation calculus and probability theory frameworks p. 358
The first contest on multi-agent systems based on computational logic p. 373
Implementing pheromone-based, negotiating forager agents p. 385
Extending tropos for a prolog implementation: a case study using the food collecting agent problem p. 396
Reactive food gathering p. 406
Strategies for multi-agent coordination in a grid world using Petri nets p. 414
Multi-agent systems in computational logic: challenges and outcomes of the SOCS project p. 420
