Preface p. 1
Optimal and robust design of a road vehicle suspension system p. 3
Influences of suspension kinematics on pitching dynamics of cars in longitudinal manoeuvring p. 23
Track settlement prediction using computer simulation tools p. 37
Dynamic train/track interaction including state-dependent track properties and flexible vehicle components p. 47
A new approach for the modelling of track geometry recording vehicles and the deconvolution of versine measurements p. 59
A 3-level driver model and its application to driving simulations p. 71
Driver models in vehicle development p. 83
Analysis of driver's steering and speed control strategies in curve negotiation p. 94
A driver model as development tool for vehicle handling design p. 110
An analysis of driver's control algorithm using neural network modeling p. 122
Load impacts at railway turnout crossing p. 131
Simulation of wheel/rail interaction in turnouts and special track work p. 143
Derailment simulation, parametric study p. 155
Road test data procedures for evaluating the hunting instability threshold of a railway vehicle from on board measurements p. 168
Self-steering trucks using unsymmetric suspension with independently rotating wheels - Comparison between stand tests and calculations p. 180
Industry demands on vehicle development - methods and tools p. 202
Software tools for mechatronic vehicles: Design through modelling and simulation p. 214
Methodologies for coupling simulation models and codes in mechatronic system analysis and design p. 231
European activities and standardisation efforts in mechatronics p. 244
Nonlinear cruise control concepts for vehicles in convoy p. 256
Manual and automatic control of the longitudinal dynamics of individual motor vehicles p. 270
Vision system for avoidance of lane-departure p. 282
Angle of attack and distance-based criteria for flange climb derailment p. 293
Guidance and stability of articulated railway vehicles with single axles and various forms of passive and active steering p. 306
Performance analysis and experience gained with linear and non-linear wheelset guidance systems for trailing and motorised self-steering bogies p. 318
Structural variable models for simulating the vehicle dynamics at low velocities p. 326
Dynamics of flexible multibody systems having rolling contact: Application of the wheel element to the dynamics of road vehicles p. 338
Parameter identification in heavy vehicle simulation p. 350
A study of the performance and stability of articulated towing vehicle and boat trailer combinations p. 362
An investigation of the effect of bogie and wagon pitch associated with longitudinal train dynamics p. 374
Methods for the validation of algorithms for the simulation of longitudinal dynamics p. 386

How to improve the running behaviour of freight wagons with UIC-link suspension p. 394
Instability phenomena of a passenger coach, caused by internal yaw damper Flexibility p. 406

A mechatronic approach for active influence on railway vehicle running behaviour p. 418
Simulation and control design for mechatronic pantographs p. 431
Mechatronic control of an actively guided rail vehicle p. 442
Hardware-in-loop simulation of railway vehicles with tilting and active suspension systems p. 453
Lateral dynamics of a railway vehicle in tangent track and curve: Tests and simulation p. 464

Dynamic interaction between pantograph and overhead track equipment for heavy haul operations p. 478
Modelling and simulation of catenary-pantograph interaction p. 490
Tunnel mover guidance and stability p. 502
Energy loss in truck tyres and suspensions p. 516
A three-dimensional airspring model with friction and orifice damping p. 528
On-board estimation of the rollover threshold of tractor semitrailers p. 540
Hopf bifurcation and nonlinear oscillations in railway vehicle systems p. 552
Dynamic modelling of an off-road vehicle for the design of a semi-active, hydropneumatic spring-damper system p. 566
Ride control - A two-state suspension design for cabs and seats p. 578
On-line estimation of local road gradient for improved steady state suspension deflection control p. 590
Vehicle-track dynamics on a ramp and on the bridge: Simulation and measurements p. 604
Investigation of contact stresses on the wheel/rail system at steady state Curving p. 616

A comparison of various theories on the interaction between wheel and rail p. 629
The effect of railway vehicle-track system geometric deviations and its dynamics in the turnout zone p. 641
Wheelset control strategies for a two-axle railway vehicle p. 653
Improvement of vehicle handling safety with vehicle side-slip control by direct yaw moment p. 665
Effects of integrated control of active four wheel steering and individual wheel torque on vehicle handling and stability - A comparison of alternative control strategies p. 680

Steer-by-wire-oriented steering system design: Concept and examination p. 692
The development of an active roll control system for heavy vehicles p. 704
Modelling the dynamics of a vehicle with active geometry suspension p. 716
A fast wheel-rail forces calculation computer code p. 728
Compatibility of curving performance and hunting stability of railway bogie p. 740
Lateral vibration of middle cars of Shinkansen train in tunnel section (Analysis of running characteristics of test train due to gap flow induced model) p. 749

Olley's "Flat Ride" revisited p. 762
