AN INTRODUCTION TO VEGETATION ANALYSIS
Principles, practice and interpretation

D. R. CAUSTON
Department of Botany and Microbiology,

Contents

Preface \hspace{1cm} page vii

List of tables \hspace{1cm} xiii

Acknowledgements \hspace{1cm} xix

1 Introduction \hspace{1cm} 1

- Nature of vegetation and analytical approaches \hspace{1cm} 1
- Purposes of vegetation analysis \hspace{1cm} 3
- Phytosociological and more objective methods \hspace{1cm} 4
- Samples \hspace{1cm} 5
- Types of data \hspace{1cm} 7

2 Field methods \hspace{1cm} 11

- Primary survey – many species \hspace{1cm} 11
- More detailed field work – one or a few species \hspace{1cm} 17
- Plotless sampling \hspace{1cm} 28

3 Fundamental principles of analytical methods \hspace{1cm} 32

- The geometric model \hspace{1cm} 32
- Classification and ordination \hspace{1cm} 34
- Normal and inverse analyses \hspace{1cm} 36
- Qualitative and quantitative data \hspace{1cm} 36
- Species of low occurrence in a data set – retain or discard? \hspace{1cm} 42

4 Case studies – introduction \hspace{1cm} 44

- Artificial Data \hspace{1cm} 44
- Iping Common – a lowland heath \hspace{1cm} 45
- Coed Nant Lolwyn – a deciduous wood \hspace{1cm} 52
# CONTENTS

## 5 Association between species and similarity between stands
- Concepts .................................................. 71
- Qualitative data ........................................ 72
- Quantitative data ....................................... 89
- Comparisons of similarity coefficients .............. 95

## 6 Classification
- Normal Association Analysis .......................... 98
- Types of classification ................................ 104
- Divisive monothetic methods ......................... 106
- Agglomerative polythetic methods .................... 115
- Divisive polythetic methods .......................... 122
- Comparison of the methods by the examples results 138
- Inverse classifications ................................ 138
- Nodal Analysis (Lambert & Williams 1962) ........ 143

## 7 Ordination
- A classification of ordinations ....................... 146
- Direct Gradient Analysis – one factor ............... 155
- Direct Gradient Analysis – many factors .......... 157
- Indirect Gradient Analysis – one factor .......... 169
- Indirect Gradient Analysis – many factors (ordination *sensu stricto*) 171
- Polar ordination ........................................ 173
- Non-polar ordination .................................. 188
- Comparisons of ordination methods ................. 213

## 8 Correlations between vegetation and environment
- Single species ........................................... 223
- Several species ....................................... 232
- Environmental factors in associations .............. 239

## 9 Case studies – analyses
- Iping Common .......................................... 244
- Coed Nant Lolwyn ...................................... 284
- Concluding remarks on vegetation analysis results 323

References ................................................ 325

Indices ..................................................... 330
