## Contents

### Preface

1. Introduction and overview
2. Lipid diversity and distribution
   2.1. Chemical diversity of lipids
   2.2. Membrane lipid compositions
   2.3. Transbilayer lipid asymmetry
3. Model membrane systems
   3.1. Lipid isolation and purification
   3.2. Techniques for making model membrane vesicles
   3.3. Techniques for making planar bilayers and monolayers
   3.4. Reconstitution of integral membrane protein into vesicles
4. Physical properties of lipids
   4.1. Gel-liquid-crystalline phase behaviour
   4.2. Lipid polymorphism
   4.3. Factors which modulate lipid polymorphism
   4.4. The physical basis of lipid polymorphism
5. Lipids and the permeability properties of membranes
   5.1. Theoretical considerations
   5.2. Permeability of water and non-electrolytes
   5.3. Permeability of ions
6. Lipid–protein interactions
   6.1. Extrinsic proteins
   6.2. Intrinsic proteins
7. Lipids and membrane fusion
   7.1. Fusion of model systems
   7.2. Fusion of biological membranes
8. Model membranes and drug delivery
9. Future directions
References

### Chapter 1. Physical properties and functional roles of lipids in membranes

**Pieter R. Cullis and Michael J. Hope**

1. Introduction and overview
2. Lipid diversity and distribution
   2.1. Chemical diversity of lipids
   2.2. Membrane lipid compositions
   2.3. Transbilayer lipid asymmetry
3. Model membrane systems
   3.1. Lipid isolation and purification
   3.2. Techniques for making model membrane vesicles
   3.3. Techniques for making planar bilayers and monolayers
   3.4. Reconstitution of integral membrane protein into vesicles
4. Physical properties of lipids
   4.1. Gel-liquid-crystalline phase behaviour
   4.2. Lipid polymorphism
   4.3. Factors which modulate lipid polymorphism
   4.4. The physical basis of lipid polymorphism
5. Lipids and the permeability properties of membranes
   5.1. Theoretical considerations
   5.2. Permeability of water and non-electrolytes
   5.3. Permeability of ions
6. Lipid–protein interactions
   6.1. Extrinsic proteins
   6.2. Intrinsic proteins
7. Lipids and membrane fusion
   7.1. Fusion of model systems
   7.2. Fusion of biological membranes
8. Model membranes and drug delivery
9. Future directions

### Chapter 2. Lipid metabolism in procaryotes

**S. Jackowski, J.E. Cronan Jr. and C.O. Rock**

1. The study of bacterial lipid metabolism
2. Historical introduction
3. An overview of phospholipid metabolism in *E. coli*
4. Genetic analysis of lipid metabolism
5. Membrane systems of *E. coli*
Chapter 4. Fatty acid synthesis in eucaryotes

Alan G. Goodridge

1. Introduction .......................................................... 111
2. Signals in blood that mediate the effects of diet .................................................. 112
3. Which enzymes regulate fatty acid synthesis? ..................................................... 114
4. Regulation of substrate supply ................................................................. 115
   4.1. Production of pyruvate from glucose .................................................. 115
   4.2. Production of citrate from pyruvate ................................................ 115
   4.3. Production of NADPH ................................................................. 117
5. Regulation of the catalytic efficiency of acetyl-CoA carboxylase ................................ 117
   5.1. A key regulatory reaction .......................................................... 117
   5.2. Structure and reaction mechanism .................................................. 118
   5.3. Regulation by citrate ....................................................................... 118
   5.4. Regulation by long-chain fatty acyl-CoA .......................................... 119
   5.5. Regulation by covalent modification ............................................... 121
6. Fatty acid synthase .............................................................. 125
   6.1. Animal fatty acid synthase: the component reactions ..................................... 125
   6.2. Animal fatty acid synthase: the subunits are identical .......................... 127
   6.3. Animal fatty acid synthase: structural organization .................................... 128
   6.4. Comparison of yeast and animal fatty acid synthases ............................. 129
7. Regulation of enzyme concentration ........................................................... 130
   7.1. Messenger RNA levels regulate enzyme synthesis rates ............................ 130
   7.2. Transcription is usually the regulated step ....................................... 131
   7.3. Regulation in cells in culture .......................................................... 134
      7.3.1. 3T3-L1 cells—a pre-adipocyte cell line .................................. 134
      7.3.2. Hepatocytes in maintenance culture .......................................... 135
8. Future directions .............................................................. 137
References ........................................................................ 138

Chapter 5. Fatty acid desaturation and chain elongation in eucaryotes

Harold W. Cook

1. Introduction ........................................................................ 141
2. Historical background .......................................................... 143
3. Chain elongation of long chain fatty acids ...................................................... 144
### Table of Contents

3.1. The microsomal elongation system .......................... 146
3.2. The mitochondrial elongation system ......................... 147
3.3. Functions of the two elongation systems ..................... 148

4. Formation of monounsaturated fatty acids by oxidative desaturation .......................... 148
4.1. Nomenclature to describe double bonds ...................... 148
4.2. Characteristics of the monoene-forming desaturation enzymes .................. 149
4.3. Modification of Δ9 desaturase activities in vitro ............ 151
4.4. Dietary and hormonal regulation of Δ9 desaturase ............ 152
4.5. Formation of monounsaturated fatty acids in plants .......... 154

5. Formation of polyunsaturated fatty acids ...................... 154
5.1. Characteristics and restrictions in animal systems .......... 154
5.2. Essential fatty acids—a contribution of plant systems ....... 155
5.3. Families of fatty acids and their metabolism ................. 157
  5.3.1. The (n-6) family ........................................ 157
  5.3.2. The (n-3) family ........................................ 159
  5.3.3. Competition between the (n-6) and (n-3) families .......... 160
  5.3.4. The (n-9) family ........................................ 161
  5.3.5. The (n-7) family ........................................ 161
5.4. Dietary and hormonal alterations of polyunsaturated acid synthesis ..................... 161
5.5. Two or more double bonds in plants .......................... 163

6. Unsaturated fatty acids with trans double bonds .................. 164

7. Abnormal patterns of distribution and metabolism of long chain saturated and unsaturated fatty acids .......................... 165
  7.1. Essential fatty acid deficiency ............................ 165
  7.2. Zinc deficiency ............................................. 166
  7.3. Other clinical disorders .................................... 166
  7.4. Relationship to plasma cholesterol .......................... 166
7.5. Future directions ............................................. 167

8. References ...................................................... 168

---

**Chapter 6. Metabolism of triacylglycerols**

*David N. Brindley*

1. Introduction ................................................... 171
2. Biosynthesis of triacylglycerols ................................ 173
  2.1. Biosynthesis of phosphatidate ................................ 173
  2.2. Conversion of phosphatidate to triacylglycerol ................ 178
  2.3. Conversion of monoacylglycerol to triacylglycerol .............. 179
3. Digestion, absorption and transport of lipids .................... 181
  3.1. Digestion of lipids .......................................... 181
  3.2. Absorption of lipids from the small intestine .................. 183
  3.3. Formation of chylomicrons and VLDL .......................... 184
  3.4. Partitioning of fatty acids between the portal blood and the lymphatic system .......... 186
4. Control of triacylglycerol synthesis ............................ 187
  4.1. Control of phosphatidate synthesis in the liver ................ 188
  4.2. Control of the conversion of phosphatidate to triacylglycerol in liver .............. 189
  4.3. Diacylglycerol as a precursor of triacylglycerol, phosphatidylcholine and phosphatidylethanolamine .......................... 193
5. Metabolism of triacylglycerols when the action of insulin is high ..................... 195
6. Triacylglycerol metabolism in conditions of metabolic stress ..................... 198
Chapter 7. Phospholipid metabolism and cell signalling in eucaryotes

Dennis E. Vance

1. Introduction ......................................................................................... 205

2. Phosphatidylcholine biosynthesis ....................................................... 206
   2.1. Historical background .................................................................. 206
   2.2. Choline transport and oxidation .................................................. 207
   2.3. Enzymes of the CDP-choline pathway .......................................... 207
   2.4. Phosphatidylethanolamine-N-methyltransferase .......................... 208

3. Regulation of phosphatidylcholine biosynthesis ............................... 209
   3.1. The rate-limiting reaction ............................................................ 209
   3.2. The translocation hypothesis ....................................................... 210
   3.3. Regulatory mechanisms ............................................................. 210
       3.3.1. Fatty acids are important regulators of phosphatidylcholine biosynthesis in cultured cells .............. 211
       3.3.2. Diacylglycerol may also regulate phosphatidylcholine biosynthesis ...................................................... 211
       3.3.3. Phosphorylation–dephosphorylation reactions ...................................................................................... 212
       3.3.4. Feedback regulation .............................................................. 212
       3.3.5. Cholinephosphotransferase ................................................. 213
   3.4. Substrate channeling .................................................................... 213

4. Sphingomyelin biosynthesis .............................................................. 214

5. Phosphatidylserine biosynthesis ....................................................... 215
   5.1. Historical developments and biosynthesis .................................... 215
   5.2. CHO mutants and regulation ....................................................... 217

6. Phosphatidylethanolamine biosynthesis ........................................... 218
   6.1. Historical background ............................................................... 218
   6.2. Enzymes of the CDP-ethanolamine pathway .............................. 218
   6.3. Regulation of the CDP-ethanolamine pathway ............................ 219
       6.3.1. Regulation at the cytidylyltransferase reaction ................. 219
       6.3.2. Diacylglycerol .................................................................. 220
   6.4. Phosphatidylserine decarboxylation and the relative importance of the various pathways for phosphatidylethanolamine biosynthesis .................................................................................. 221
   6.5. N-acyl-phosphatidylethanolamine ................................................. 221

7. Polyglycerophospholipids ................................................................. 222
   7.1. Historical developments and biosynthetic pathways .................... 222
   7.2. Enzymes and subcellular location ............................................... 224

8. Inositol phospholipids ...................................................................... 224
   8.1. Historical developments ............................................................ 224
   8.2. Biosynthetic enzymes ............................................................... 225

9. Phospholipids as precursors of cellular second messengers ............ 226
   9.1. Discovery of the phosphatidylinositol cycle .................................. 226
   9.2. Degradation of phosphatidylinositol-4,5-bisphosphate by phospholipase C ....................................................... 227
   9.3. Metabolism of the inositol phosphates ....................................... 228
   9.4. Function of inositol phosphates .................................................. 229
   9.5. Diacylglycerol and protein kinase C .......................................... 230
   9.6. Phosphatidylcholine cycles and formation of diacylglycerol ........ 231
Chapter 9. Phospholipases
Moseley Waite

1. Overview
   1.1. Definition of phospholipases
   1.2. Assay of phospholipases
   1.3. Interaction of phospholipases with interfaces

2. The phospholipases
   2.1. Phospholipase A$_2$
   2.2. Phospholipase B and lysophospholipases
   2.3. Phospholipase A$_2$
   2.4. Phospholipase C
   2.5. Phospholipase D
   2.6. Phospholipases in signal transduction

3. Future directions

References

Chapter 10. The eicosanoids: cyclooxygenase, lipoxygenase, and epoxygenase pathways
William L. Smith, Pierre Borgeat and Frank A. Fitzpatrick

1. Introduction

2. Prostanoids
   2.1. Structures and nomenclature
   2.2. Prostanoid chemistry
   2.3. Prostanoid biosynthesis
   2.4. Arachidonate release
   2.5. Prostaglandin endoperoxide formation
   2.6. Physico-chemical properties of PGH synthase
   2.7. PGH synthase and nonsteroidal anti-inflammatory drugs
   2.8. Anti-inflammatory steroids
   2.9. PGH synthase active site
   2.10. Regulation of PGH synthase gene expression
   2.11. PGH$_2$ metabolism
   2.12. Catabolism: prostanoids as local hormones

3. Hydroxy- and hydroperoxy-eicosaenoic acids and leukotrienes
   3.1. Introduction and overview
   3.2. Mechanism of leukotriene biosynthesis in human neutrophils
   3.3. The enzymes of the 5-lipoxygenase pathway
   3.4. Regulation of leukotriene synthesis
   3.5. The metabolism of lipoxygenase products
   3.6. Biological activities of leukotrienes

4. Epoxygenase products
   4.1. Introduction
   4.2. Structures, nomenclature, and biosynthesis
   4.3. Occurrence of epoxygenosatrienoic acids
   4.4. Metabolism of epoxygenase metabolites of arachidonic acid
   4.5. Biological actions of 'epoxygenase' derived EpETrEs and HETrEs
Chapter 12. Cholesterol: evolution of structure and function
Konrad Bloch

1. Natural occurrence of sterols
2. Metabolic and precursor functions of the sterol molecule
3. Sterol patterns
4. Sterols and membrane function
   4.1. Function of sterols in animal membranes
   4.2. Sterol auxotrophs
   4.3. Metabolic regulation in the membrane environment
   4.4. Fluidity control
5. Regulatory roles for sterols in membranes
   5.1. Fungi and invertebrates
   5.2. Sterol effects on hormone and neurotransmitter receptors
   5.3. Sterols and fusion of viral membranes
   5.4. Capping of surface immunoglobulin
   5.5. Sterol effects on enzyme activities
   5.6. Effects of cholesterol on phospholipid synthesis
6. Evolution of the sterol structure
7. Future directions
References

Chapter 13. Regulation of sterol biosynthesis and isoprenylation of proteins
Peter A. Edwards

1. Introduction
2. Regulation of cholesterol synthesis
3. Regulation of cholesteryl ester synthesis
4. Transcriptional control of cholesterol synthesis
5. Posttranscriptional regulation
6. Identification of the physiological regulators
7. Regulation of bile acid synthesis
8. Isoprenylation of proteins
9. Future directions
References

Chapter 14. Lipoprotein structure and secretion
Roger A. Davis

1. Introduction
2. Structure and function of plasma lipoproteins
   2.1. Chylomicrons and very low density lipoproteins
   2.2. Structure: surface components
   2.3. Core components
   2.4. Low density lipoproteins: structure
      2.4.1. Origin of low density lipoproteins
      2.4.2. High density lipoproteins: structure and function
      2.4.3. Discoidal high density lipoproteins
3. Future directions
4. References
5. Cholesteryl ester transfer protein and the later metabolism of lipoprotein cholesterol 452
   5.1. Introduction 452
   5.2. Structure of cholesteryl ester transfer protein 454
   5.3. Mechanism of cholesteryl ester transfer protein activity 454
   5.4. Quantitation of cholesteryl ester transfer 456
   5.5. Physiological regulation of cholesteryl ester transfer protein 456
   5.6. Congenital cholesteryl ester transfer protein deficiency 457
   5.7. Cholesteryl ester transfer protein inhibitor protein 457
6. Summary and future directions 457
References 458

Chapter 16. Removal of lipoproteins from plasma
Wolfgang J. Schneider 461

1. Introduction 461
2. Removal of low density lipoprotein from the circulation 464
   2.1. Receptor-mediated endocytosis 464
   2.2. The low density lipoprotein receptor pathway 465
      2.2.1. Familial hypercholesterolemia: clinical consequences of low density lipoprotein receptor dysfunction 466
      2.2.2. Biochemical findings in cultured fibroblasts from familial hypercholesterolemia homozygotes 467
   2.3. Biosynthesis and structure of the low density lipoprotein receptor 467
      2.3.1. The low density lipoprotein receptor protein 468
      2.3.2. The ligand binding domain 469
      2.3.3. The EGF precursor homology domain 470
      2.3.4. The third domain 470
      2.3.5. The membrane anchoring domain 470
      2.3.6. The cytoplasmic tail 471
   2.4. Molecular defects in low density lipoprotein receptors of patients with familial hypercholesterolemia 471
      2.4.1. The gene for the human low density lipoprotein receptor 471
      2.4.2. Four groups of low density lipoprotein receptor mutations 472
      2.4.2.1. Class 1: no detectable precursor 472
      2.4.2.2. Class 2: slow or absent processing of precursor 472
      2.4.2.3. Class 3: abnormal ligand binding 473
      2.4.2.4. Class 4: internalization defective 474
3. Catabolism of chylomicrons 475
4. High density lipoprotein as a transport vehicle 477
5. Atherosclerosis 478
   5.1. Uptake and modification of low density lipoprotein in the intima 478
   5.2. Scavenger receptors 480
6. Lipoprotein transport in the laying hen 481
7. Low density lipoprotein metabolism by rat serosal mast cells 483
8. Future directions 485
References 485
**Chapter 17. Lipid assembly into cell membranes**

*Denis R. Voelker*

1. Introduction ........................................... 489
2. The diversity of lipids .................................. 489
3. Methods to study intra- and inter-membrane lipid transport .................................................. 492
   3.1. Fluorescent probes ................................... 494
   3.2. Spin labeled analogs .................................. 494
   3.3. Asymmetric chemical modification of membranes .................................................. 495
   3.4. Phospholipid transfer proteins .......................... 496
   3.5. Rapid plasma membrane isolation ......................... 497
   3.6. Organelle specific lipid metabolism ................. 498
4. Lipid transport processes ................................ 498
   4.1. Intramembrane lipid translocation and model membranes ........................................ 498
   4.2. Intramembrane lipid translocation and biological membranes .................................. 502
      4.2.1. Procaryotes ......................................... 502
      4.2.2. Eucaryotes ........................................... 503
      4.2.2.1. Transbilayer movement at the endoplasmic reticulum ................................ 503
      4.2.2.2. Transbilayer movement of phosphatidylcholine in erythrocytes ....................... 504
      4.2.2.3. Transbilayer movement of phosphatidylcholine in nucleated cells ................. 505
      4.2.2.4. ATP dependent transbilayer movement of aminophospholipids at the plasma membrane of eukaryotic cells .................. 506
   4.3. Intermembrane lipid transport ......................... 507
      4.3.1. Transport in procaryotes .......................... 507
      4.3.2. Transport in eucaryotes ............................ 510
      4.3.2.1. Phosphatidylcholine ................................ 510
      4.3.2.2. Phosphatidylethanolamine ......................... 512
      4.3.2.3. Phosphatidylerine ................................ 513
      4.3.2.4. Sphingolipids ..................................... 515
      4.3.2.5. Cholesterol ....................................... 517
      4.3.2.6. Phospholipid transfer proteins and phosphatidylinositol transport ................ 518
5. Future directions .......................................... 521
References .................................................. 522

**Chapter 18. Assembly of proteins into membranes**

*Reinhart A.F. Reithmeier*

1. Organization of membrane proteins ....................... 525
   1.1. Classification of membrane proteins .................. 525
   1.2. Membrane protein structure and energetics .......... 528
   1.3. Assembly of membrane proteins ....................... 530
2. Secretion of proteins and the signal hypothesis .......... 532
   2.1. The Palade secretion pathway ......................... 533
   2.2. The Blobel signal hypothesis ........................... 533
   2.3. In vitro translation and translocation systems ........ 535
   2.4. The Milstein experiment: secreted proteins are made with an amino terminal signal sequence .................. 538
   2.5. Signal sequences ...................................... 540
