2.4 Discussion .................................................. 32

3 Structure and phytomass production of a pioneer community
by M. JOCHIMSEN and D. JANZEN 39
3.1 Introduction ............................................... 39
3.2 Research area and methods ............................. 40
3.3 Phytomass .................................................. 41
3.4 Number of individuals ................................ 45
3.5 Species numbers ......................................... 49
3.6 The five most productive species .................... 51
3.7 Conclusion ................................................ 56

4 Survival and growth beneath and near parents: The case of Myr-}

cianthes fragrans (Myrtaceae)
by D. F. WHIGHAM and E. CABRERA CANO 61
4.1 Introduction ............................................... 61
4.2 Study site .................................................. 62
4.3 Methods ..................................................... 63
4.4 Results ...................................................... 66
4.5 Discussion ................................................ 71

5 Colonizing success in plants: Genetic variation and phenotypic
plasticity in life history traits in Capsella bursa-pastoris
by H. HURKA and B. NEUFFER 77
5.1 Introduction ............................................... 77
5.2 History of Capsella bursa-pastoris ................... 78
5.3 Breeding system of Capsella bursa-pastoris ......... 79
5.4 Reproductive capacity ................................... 80
5.4.1 Number of seeds per fruit .......................... 80
5.4.2 Total seed output ..................................... 82
5.5 Founding of populations in new habitats .......... 83
5.5.1 Seed sizes, seed polymorphism .................... 83
5.5.2 Establishment near to the previously seeded range 85
5.5.3 Soil seed bank .......................................... 85
5.5.4 Long distance seed dispersal ....................... 87
5.6 Germination behavior ................................... 88

6 Niches of longevity and stress
by F. KLÖTZLI ................................................. 97
6.1 Introduction ............................................... 97
6.2 Circumstances of longevity ............................ 99
6.2.1 Site conditions and ecophysiological reactions of Bristlecone
pine .......................................................... 99
6.2.2 Comparable niches in Eurasia ....................... 101
6.2.3 Junipers of the Karakorum ranges .......................... 102
6.3 Conclusions ......................................................... 104
6.4 Annex: Hunza Valley area ........................................... 107
   6.4.1 Physiography .................................................. 107
   6.4.2 Climate ......................................................... 108
   6.4.3 Soil ............................................................ 110

II Mass and water balances at stand level .......................... 111

7 Plasticity of the photosynthetic production of Galium aparine L.  
by W. L. Kutsch and L. Kappen ...................................... 113
   7.1 Introduction ..................................................... 113
   7.2 Material .......................................................... 114
   7.3 Methods ........................................................... 115
   7.4 Mathematical Modelling ........................................... 116
      7.4.1 Photosynthetic light response and light acclimation 116
      7.4.2 Temperature dependence of dark respiration and photosyn-
               thesis ...................................................... 117
   7.5 Results ............................................................ 118
      7.5.1 Seasonal course of the developmental stages 118
      7.5.2 Seasonal courses of the CO₂ exchange parameters 119
      7.5.3 Adaptation of the plants to the light conditions 121
      7.5.4 Parameters of the mathematical modelling and leaf parameters122
   7.6 Conclusions ......................................................... 122

8 Diversity of photosynthetic responses in the mesic and arid Medi-
terranean-type climate regions of southern Africa  
by M. C. Rutherford .................................................... 133
   8.1 Introduction ..................................................... 133
   8.2 Photosynthetic pathways ........................................ 135
   8.3 Responses to photosynthetic photon flux density ............ 136
   8.4 Response to temperature ......................................... 139
   8.5 Responses to water .............................................. 141
   8.6 Responses to leaf to air water vapour pressure deficits 145
   8.7 Nutrient considerations ......................................... 146
   8.8 Photosynthetic capacity ........................................ 149
   8.9 Leaf and plant age effects ..................................... 150
   8.10 Conclusions ..................................................... 151

9 The combination of measurements and mathematical modelling  
for assessing canopy structure effects  
by U. Tappeiner and A. Cernusca ................................... 161
   9.1 Introduction ..................................................... 161
## 9.2 Materials and methods ................................................................. 163
  9.2.1 Sites investigated ................................................................. 163
  9.2.2 Experimental ecological methods ........................................... 165

## 9.3 Model designing ................................................................. 169
  9.3.1 Canopy structure and light climate submodel .......................... 169
  9.3.2 Single leaf photosynthesis submodel ...................................... 172
  9.3.3 Canopy photosynthesis model ............................................... 172

## 9.4 Selection and validation of the appropriate model ......................... 173
  9.4.1 Validation of the radiation model ........................................ 174
  9.4.2 Validation of the canopy photosynthesis model ....................... 177

## 9.5 Application of the presented models ......................................... 180
  9.5.1 Investigation of the dynamic changes in stand structure, light climate, and photosynthesis, following abandonment of an alpine pasture ........................................ 180
  9.5.2 Typification of structurally different plant stands in the Central Caucasus ...................................................... 182

## 9.6 Conclusion ............................................................................ 187

### 10 The water balance of deciduous forests: methods and models
by B. SAUGIER and J.-Y. PONTAILLER ............................................ 195

## 10.1 Introduction ........................................................................ 195

## 10.2 Soil Water Balance ............................................................ 196
  10.2.1 Field capacity ................................................................. 198
  10.2.2 Wilting point ................................................................ 198

## 10.3 Rainfall distribution pattern ............................................... 200
  10.3.1 Throughfall, stemflow and interception loss ......................... 200
  10.3.2 Interception by tree litter ................................................. 201

## 10.4 Evapotranspiration ............................................................... 201
  10.4.1 Soil water balance method ................................................. 201
  10.4.2 Energy balance (Bowen ratio) method .................................. 202
  10.4.3 Eddy correlation method .................................................... 202

## 10.5 Sapflow ................................................................. 203
  10.5.1 Sapflow measurement ......................................................... 203

## 10.6 Models of forest water balance .............................................. 205
  10.6.1 Evaporation of intercepted water ....................................... 206
  10.6.2 Canopy resistance $r_c$ ..................................................... 207
  10.6.3 Soil moisture and transpiration ......................................... 209

## 10.7 Conclusion ............................................................................ 209

### 11 Combination effects of water and salt stress on growth, hydration and pigment composition in wheat (*Triticum aestivum* L.): A mathematical modelling approach
by K. H. KREEB and T. CHEN .......................................................... 215
11.1 Introduction ........................................ 215
11.2 Materials and Methods ............................ 217
   11.2.1 Plants, experimental layout, and ecophysiological methods .. 217
   11.2.2 Statistical and regression analysis .................. 217
11.3 Results and Discussion ............................ 222
   11.3.1 The combination effect on plant height .......... 222
   11.3.2 The combination effect on the potential osmotic pressure ($\pi^*$) 222
   11.3.3 The combination effect on chlorophyll content .... 223
11.4 Conclusion ........................................ 227

12 Ecosystem research on grassland in the Austrian Alps and in the Central Caucasus
by A. CERNUSCA ........................................ 233
12.1 Introduction ....................................... 233
12.2 Scope of the studies and methods ................. 234
12.3 Sites investigated .................................. 238
12.4 Structure and function of alpine grassland ecosystems .. 241
   12.4.1 Altitudinal variation of water budget .......... 241
   12.4.2 Altitudinal variation of canopy structure, energy balance and microclimate ........................................ 242
   12.4.3 Altitudinal variation of phytomass, energy content and fodder value ........................................ 250
   12.4.4 Altitudinal variation of soil-microbiological processes .... 252
   12.4.5 The carbon budget of the alpine sedge mats .... 253
12.5 The effects of anthropogenic measures on alpine ecosystems .. 259
   12.5.1 The consequences of grazing on the alpine grassland .... 261
   12.5.2 The consequences of the abandonment of the alpine pastures 263
   12.5.3 The effects of skiing facilities on the water balance of the alpine grassland ecosystems .......... 264
   12.5.4 Susceptibility of alpine ecosystems to disruption, as seen in the case of hiking trails .......... 264

III Minerals and vegetation–soils interactions .................. 273

13 Multi-element analysis in plant material
by B. MARKERT ........................................ 275
13.1 Introduction ....................................... 275
13.2 Establishment of baseline values (background concentrations) .... 279
13.3 Analytical chemistry as an interdisciplinary approach .......... 284
13.4 Conclusions ....................................... 288
14 Significance of nutrient relations and symbiosis for the competitive interaction between grasses and legumes in tropical savannas
by E. Medina and B. Bilbao
14.1 Introduction ........................................... 295
14.2 Soil characteristics and vegetation composition ................ 296
14.3 Biomass distribution and storage of nutrient and mobile carbohydrates 302
  14.3.1 Nutrient content of leaves and roots ....................... 303
  14.3.2 Nutrient limitation of productivity of native grass species 305
  14.3.3 Biological interactions improving nutrient availability .... 306
14.4 Concluding remarks ..................................... 313

15 Correlations between the microbial activity, and water, air, temperature and nutrient status of different soils under different land use
by H.-P. Blume, L. Beyer and F. Friedrich
15.1 Introduction ........................................... 321
15.2 Sites and soils ......................................... 322
15.3 Methods ................................................ 325
15.4 Soil dynamics ......................................... 327
  15.4.1 Loamy Luvisols under different land use ................. 327
  15.4.2 Sandy Podzols under different land use (Fig. 15.2) .... 332
  15.4.3 Gleysols under forest (Fig. 15.3) ....................... 336
  15.4.4 Histosols under natural vegetation (Fig. 15.4) .......... 338
15.5 Comparative discussion .................................. 340

IV Disturbances and management of semi–natural and agricultural systems 347

16 Fire, dry heat and germination of savanna grasses in Botswana
by W. H. O. Ernst
16.1 Introduction ........................................... 349
16.2 Material and Methods .................................... 350
16.3 Results ................................................ 351
  16.3.1 Effect of field fire in the savanna ....................... 351
  16.3.2 Effect of dry heat .................................. 352
16.4 Discussion ............................................. 356

17 Does intermediate disturbance increase species richness within deciduous forest understory?
by R. J. Reader, K. C. Taylor and D. W. Larson
17.1 Introduction ........................................... 363
17.2 Expected effects of intermediate disturbance on deciduous forest understory ................................. 365
17.3 Selective tree harvesting effects on deciduous forest understory . . . 366
17.4 Trampling effects on deciduous forest understory .......................... 368
17.5 Does forest species richness increase following intermediate distur-
bance? .......................................................................................... 370
17.6 Conclusions ................................................................................ 371

18 Response of a Bromus erectus grassland (Mesobromion) to abandon-
ment and different cutting regimes
by H. DIERSCHKE and M. ENGELS .................................................... 375
18.1 Introduction ................................................................................ 375
18.2 Research area and methods ....................................................... 376
18.3 Results ....................................................................................... 377
  18.3.1 Comparison of species combination in one year .................. 377
  18.3.2 Changes of species combination over several years .......... 379
  18.3.3 Differences of above-ground phytomass production .......... 382
  18.3.4 Response of Bromus erectus to different cutting regimes .. 385
18.4 Discussion and conclusions ...................................................... 386
  18.4.1 Secondary succession of abandoned calcareous grassland .. 386
  18.4.2 Own results of secondary succession in comparison with the
      literature ................................................................................. 387
  18.4.3 Regeneration of Mesobromion communities ....................... 390
  18.4.4 Vitality and competitiveness of Bromus erectus ................. 391

19 Phytosociology in vineyards — results, problems, tasks
by O. WILMANNS and A. BOGENRIEDER ...................................... 399
19.1 Introduction ................................................................................ 399
  19.1.1 Framework ......................................................................... 399
  19.1.2 A short overview of previously described vineyard wild-herb
      communities ........................................................................... 400
19.2 Case study “Markgräfler Hügelland” ......................................... 401
  19.2.1 Geographical situation ...................................................... 401
  19.2.2 Available material, methods .............................................. 403
  19.2.3 Overview of the community types in the “Markgräfler Land” 411
  19.2.4 The development of the vineyard undergrowth in the “Ge-
      markung Niederegggenen” .................................................... 422
  19.2.5 Investigations on the problem of nitrogen and tilth .......... 426
19.3 Discussion and prospects ......................................................... 428
  19.3.1 Facets of Plant Sociology .................................................. 428
  19.3.2 Symmorphology and symphenology ................................. 431
  19.3.3 Ecology ............................................................................. 432
  19.3.4 Temporal change: syndynamics (succession theory) and syn-
      evolution ................................................................................. 434
  19.3.5 Sigmasociology: vegetation complexes .............................. 435
19.3.6 Biocoenology ......................................................... 437

20 The dissipation of energy through soil invertebrates in wheat field and meadow
by L. RYSZKOWSKI ............................................... 443
20.1 Introduction and area description ................................... 443
20.2 Primary production .................................................. 444
  20.2.1 Methods ....................................................... 444
  20.2.2 Values of annual primary production and inputs of plant biomass for energy requirements of heterotrophs .......... 445
20.3 Total community of soil invertebrates ................................ 447
  20.3.1 Methods of sampling and evaluating energy flow ............. 447
  20.3.2 Biomass structure and energy cost of soil maintenance .... 448
20.4 Dissipation of energy by soil–animals ................................ 451

V Eutrophication and pollution in terrestrial systems 457

21 Lead tolerance of annuals at roadsides
by U. HELLMUTH and W. SCHMIDT ................................... 459
21.1 Introduction ......................................................... 459
21.2 Materials and methods ............................................. 460
21.3 Results ............................................................... 461
  21.3.1 Lead concentration in the soil ................................ 461
  21.3.2 Plant growth and lead content ................................ 462
21.4 Discussion ........................................................... 465

22 Environmental mutagenesis: mutational load in natural populations of Eisenia fetida?
by W. NAU and W. KÖHLER .............................................. 473
22.1 Introduction ......................................................... 473
22.2 Material and Methods .............................................. 476
22.3 Results ............................................................... 478
22.4 Discussion ........................................................... 485
22.5 Appendix: Contamination of the household waste site at Hasenbühl. 493

23 The sublethal enchytraeid test system: guidelines and some results
by W. WESTHEIDE and D. BETHKE-BEILFUSS .............................................. 497
23.1 Introduction ......................................................... 497
23.2 The test guidelines ................................................. 499
23.3 Test results and discussion ....................................... 503
24 Transfer mechanisms and deposition rates of atmospheric pollutants  
by W. KUTTLER  
24.1 Introduction ........................................ 509  
24.2 The emissions of different pollutants in the Federal Republic of Germany ........................................ 510  
24.3 Mechanisms of atmospheric self-cleaning  
24.3.1 Dry deposition of pollutants  
24.3.2 Humid deposition of pollutants  
24.3.3 Wet deposition of pollutants  
24.3.4 Filtration of pollutants by vegetation  
24.3.5 Methods of measurement of dry, wet and humid deposition ........................................ 517  
24.4 Comparative analysis of pollution in an industrial agglomeration and a clean-air area ........................................ 519  
24.4.1 Concentrations of pollutants  
24.4.2 Anion equivalents  
24.4.3 Deposition of pollutants ........................................ 522  
24.5 Results of investigations of pollutant transfer into individual tree stands ........................................ 525  
24.6 Conclusion and discussion ........................................ 528  

25 Gaseous air pollutants and forest floor vegetation — a case study at different levels of integration  
by L. STEUBING and A. FANGMEIER  
25.1 Introduction ........................................ 539  
25.2 Gaseous air pollutants and their effects on forest floor vegetation — what is known? ........................................ 540  
25.3 The experiment ........................................ 541  
25.3.1 Study area ........................................ 541  
25.3.2 Fumigations ........................................ 541  
25.3.3 Vegetation analyses ........................................ 544  
25.4 Results and discussion ........................................ 544  
25.4.1 Pollutant effects at the population level ........................................ 544  
25.4.2 Pollutant effects at the micromorphological level ........................................ 550  
25.5 Pollutant effects at the physiological level ........................................ 551  
25.6 Pollutant effects at the biochemical level ........................................ 557  
25.7 Conclusions ........................................ 562  

26 Eutrophication in forest ecosystems  
by P. JAKUCS  
26.1 Introduction ........................................ 571  
26.2 Indicator populations of eutrophication ........................................ 572  
26.3 Examples of terrestrial eutrophication in forest stands ........................................ 572
XXVI

### 26.3.1 Terrestrial eutrophication as an accompanying phenomenon of the new type of forest decline 572

### 26.3.2 Terrestrial eutrophication as an accompanying phenomenon of clear-cutting 573

### 26.3.3 Terrestrial eutrophication in black locust forest stands 575

### 26.3.4 Eutrophication in forests as the deterioration in the quality of the forest 576

### 26.3.5 Terrestrial eutrophication in semi-natural forest communities 576

### 26.3.6 Natural and artificial terrestrial eutrophication 577

#### 27 Animal-coenoses in the “spruce forest” ecosystem (*Protozoa, Metazoa-invertebrates*): Indicators of alterations in forest-ecosystems

29.3.1 Carbohydrates .................................................. 628
29.3.2 Anatomical modifications ....................................... 629
29.3.3 Phytomass of herbaceous plants ............................... 629
29.3.4 Competition ....................................................... 633
29.3.5 Phytomass of woody plants ..................................... 633
29.3.6 CO$_2$ gas exchange of “model ecosystems” ................. 634
29.3.7 Mineral content .................................................. 641
29.3.8 Water budget .................................................... 644
29.4 Modelling the CO$_2$ effect ......................................... 647

30 Tropical grasslands and their role in the global carbon cycle
by D. O. Hall and J. M. O. Scurlock .................................. 659
30.1 The importance of tropical grasslands .......................... 659
30.2 Accounting for carbon flows ...................................... 663
30.3 Response to changes in atmospheric carbon dioxide .......... 663
30.4 Effect of changes in other environmental factors ............. 667
30.5 The UNEP grassland productivity project ....................... 668
30.6 Grassland burning and the global carbon cycle ................ 669
30.7 Present and future work .......................................... 671
30.8 Conclusions ......................................................... 672

31 Osnabrück Biosphere Model: structure, construction, results
by G. Esser ................................................................. 679
31.1 Introduction ......................................................... 679
31.2 General model concept ............................................ 683
31.3 Model construction ................................................ 685
  31.3.1 Net primary productivity .................................... 686
  31.3.2 Litter production .............................................. 691
  31.3.3 Litter depletion ............................................... 692
  31.3.4 Soil organic carbon production .............................. 692
  31.3.5 Soil organic carbon depletion ............................... 693
  31.3.6 Leaching of dissolved and particulate organic carbon (DOC
                  and POC) .................................................. 693
  31.3.7 Land-use changes and deforestation ......................... 693
31.4 Geographical data for running the model ........................ 696
31.5 Fundamental model results ....................................... 697
31.6 Conclusions ......................................................... 703

32 Vegetation and climate: a tenuous link
by J. Grace .............................................................. 711
32.1 Introduction ....................................................... 711
32.2 Soils will change .................................................. 712
32.3 Climate warming in the uplands .................................. 713
32.4 Some negative effects of temperature on productivity ......... 716
32.5 Northern and southern plants ............................................. 717
32.6 Beware of pests, diseases, droughts and winds .................. 718
32.7 What should we do? ..................................................... 718

VII Remote sensing and geographic modelling 723

33 Global ecology: the role of remote sensing
by D. E. Wickland .......................... 725
33.1 Introduction ......................................................... 725
33.2 Ecological information from remote sensing ...................... 726
  33.2.1 The interaction of electromagnetic radiation with the Earth’s
        surface .......................................................... 726
  33.2.2 Basic observations across the electromagnetic spectrum .. 727
  33.2.3 Specialized measurements and observation techniques ...... 738
33.3 Discussion ........................................................... 740
33.4 Conclusions .......................................................... 741

34 Search for geographic scale regularities in ecosystem processes
by A. I. Breymeyer ......................... 751
34.1 Introduction ......................................................... 751
34.2 Definitions and assumptions ......................................... 752
34.3 Geographical changeability of production and decomposition of
    organic matter — review of selected maps .......................... 754
34.4 Production and decomposition of litter on two climatic transects
34.4.1 North–South transect ........................................... 759
34.4.2 Mountain transect ................................................ 765

35 Geographic modeling and modern ecology
by E. O. Box and V. Meentemeyer 773
35.1 Introduction ......................................................... 773
35.2 Predictive modeling ................................................ 774
35.3 Building geographic models ........................................ 776
35.4 Ecological phenomena and global patterns ....................... 777
  35.4.1 The thermal pattern ........................................... 778
  35.4.2 The moisture pattern ......................................... 782
  35.4.3 The throughput pattern ...................................... 784
  35.4.4 The accumulation pattern .................................... 788
  35.4.5 Other phenomena ............................................... 790
35.5 Geographic inventories .............................................. 790
35.6 Validating geographic models ..................................... 791
35.7 Conclusion .......................................................... 793
VIII Urban and landscape ecology 805

36 Distribution patterns of flowering plants in the city of Zurich
by E. LANDOLT 807
36.1 Introduction ......................................................... 807
36.2 Methods of the inventory ........................................... 808
36.3 Some ecological characteristics of Zurich ....................... 808
36.4 Some distribution patterns ......................................... 810
36.4.1 Common species .................................................... 810
36.4.2 Frequent but not common species ................................ 812
36.4.3 Plants common or rather common 150 years ago which have become infrequent ......................................................... 815
36.4.4 Typical species of the developed areas .......................... 816
36.4.5 Species of southern slopes ....................................... 818
36.4.6 Species of northern slopes and higher altitudes ............... 818
36.4.7 Species with a southern limit .................................... 818
36.4.8 Mountain species .................................................. 818
36.4.9 Shore species ...................................................... 818
36.4.10 Species introduced by the Sihl river ......................... 820
36.5 Neophytes ............................................................. 820
36.6 Discussion ............................................................ 820

37 Urban ecosystems and coastal management
by M. NUMATA 823
37.1 Introduction ............................................................ 823
37.2 The history of Tokyo Bay and its coastal zone .................... 824
37.3 The Keiyo Industrial Zone and bay–coast cities ................. 825
37.4 Concluding remarks .................................................... 828

38 Landscape ecology — fundamentals, aims and perspectives
by H. LESER and H. RODD 831
38.1 What is "landscape ecology"? ........................................ 831
38.1.1 Definition of the subject matter of landscape ecology .......... 833
38.1.2 Landscape ecology as a scientific branch ....................... 833
38.2 Methodical and methodological perspectives of landscape ecology 835
38.2.1 Who practices landscape ecology? .............................. 835
38.2.2 Problems of landscape ecological methodology seen from the practical point of view ......................................................... 836
38.3 Landscape ecology — "ecological policy" — methodology: Is there some interdependence? ................................................. 839
38.3.1 "Ecological planning" and "ecological policy" .................... 839
38.3.2 Possibilities and limits of landscape ecological methodology .... 840
38.4 Landscape ecology — Where does it lead to? ..................... 842
