Foreword ........................................................................................................ v
Preface .......................................................................................................... vii

PANEL DISCUSSIONS

Important current problems in drug design that may be computationally tractable .................................................. 1
Panelists: Dave Doherty, Bill Dunn, Graham Richards, and Doug Rohrer
Moderators: A.J. Hopfinger and W.J. Howe

New problems that should be addressed in the next ten years .......... 7
Panelists: Gordon Crippen, Simon Kearsley, Garland Marshall, and Phil Portoghese
Moderator: Jeff Blaney

MOLECULAR PROPERTIES

Matching of chemical and biological structures using subgraph and maximal common subgraph isomorphism algorithms ................................................................. 11
Peter Willett

Molecular similarity ....................................................................................... 39
W. Graham Richards and Daniel D. Robinson

Modeling the effect of solvation on structure, reactivity, and partitioning of organic solutes: Utility in drug design............. 51
Candee C. Chambers, David J. Giesen, Gregory D. Hawkins, Christopher J. Cramer, Donald G. Truhlar, and Wouter H.J. Vaes

Cell-based methods for sampling in high-dimensional spaces .......... 73
Jason A. Rush

A preliminary multiobjective analysis of the chemotherapeutic benefits of hairpin-linked polyamides .................................................. 81
Wynn L. Walker, David S. Goodsell, Richard E. Dickerson, and Elliot M. Landaw
CONTENTS

Receptor-Based Modeling

Using structural information for the creative design of molecules ......................................................... 93
Colin McMartin and Regine S. Bohacek

GrowMol, a de novo computer program, and its application to thermolysin and pepsin: Results of the design and synthesis of a novel inhibitor ................................................................. 103
Regine Bohacek, Colin McMartin, Peter Glunz, and Daniel H. Rich

Deducing objective site models by mixed integer programming ............................................................... 115
Gordon M. Crippen

Numerical Methods

Molecular dynamics information extraction ................................................. 127
Dennis Sprous, Weidong Wang, Ganesan Ravishanker, Matthew A. Young, and David L. Beveridge

Ionic charging free energies using Ewald summation ........................................... 149
Tom Darden

Genetic function approximation: Evolutionary construction of novel, interpretable, nonlinear models of experimental data ......................................................... 163
David Rogers

Applications of distributed computing to conformational searches ........................................................ 191
Brian T. Luke
