List of Contributors xxi
Abbreviations xxxiii

1. Basic immunofluorescence 1

Victoria J. Allan

1. Introduction 1
   Important considerations 1

2. Growing cells on coverslips 2

3. Fixation 4
   Solvent fixation 7
   Fixation by chemical cross-linking 8
   Aldehyde cross-linking 8
   Other cross-linkers 11

4. Permeabilization 12
   Pre-extraction before fixation 14

5. Labelling protocols 15
   Antibody quality and preparation 16
   Single versus multiple labelling 17
   Mounting coverslips for microscopy 18

6. Controls 20

7. Double labelling as a means for localizing your protein within the cell 21
   Cytoskeletal structures 21
   Membranous organelles 21
   Endoplasmic reticulum 21
   Golgi apparatus, endosomes and lysosomes 23
   Mitochondria 23

Acknowledgements 25
References 25

2. Immunofluorescent labelling of sections 27

Alison J. North and J. Victor Small

1. Introduction 27
## Contents

2. Choice of sectioning procedure 28  
   Conventional (5–10 μm) sections 28  
   Semi-thin (0.1–1 μm) sections 28  
   The pros and cons 28  
   Methods of tissue preparation for semi-thin sectioning 29  

3. Tissue fixation 32  
   Principles of fixation and the immunocytochemical compromise 32  
   Preparation of buffered fixative solutions 33  
   Fixation and processing for aldehyde-sensitive antigens 34  

4. Preparation of conventional (5–10 μm) sections 34  

5. Preparation of semi-thin (0.1–1 μm) sections 34  
   Processing tissue 34  
   Processing single cells or cellular aggregates 35  
   Section thickness 36  
   Handling semi-thin sections 37  
   Sectioning by the Tokuyasu method 38  
   Cryoprotection 38  
   Mounting and freezing 38  
   Sectioning 38  
   Section retrieval 39  
   Sectioning of PVA-embedded material 40  
   Embedding in PVA 40  
   Sectioning 40  

6. Immunofluorescent labelling 42  
   Labelling procedure 42  
   Primary and secondary antibodies 42  
   Optimization of labelling conditions 42  
   Controls 43  
   Strategies for multiple immunolabelling 43  

7. Autofluorescence 45  

8. Anti-fading mountants 46  

9. Concluding remarks 46  

References 47  

---

3. Simultaneous *in situ* detection of DNA and proteins 51  

*Klaus Ersfeld and Elisa M. Stone*  

1. Introduction 51  

2. Preparation of labelled DNA probes 51  
   Labelling of DNA by nick translation 52
Contents

Labelling of DNA by PCR 54
3'-Labelling of oligonucleotides for FISH probes 55

3. Preparation of cells 56

4. Combined immunofluorescence and in situ hybridization 58

5. Applications of combined immunofluorescence and FISH in yeast 60
   Co-localizing chromosomal proteins and chromosomal domains 60
   Co-localizing cytoskeletal proteins and chromosomal domains 62

6. Microscopy and image analysis 64
Acknowledgements 65
References 65

4. Instruments for fluorescence imaging 67

W. B. Amos

1. Introduction 67
2. Light budget 70
3. Comparing instruments 71
   Quantum efficiency 71
   Noise 73
   Dynamic range 73
   Photon counting 74
4. Getting the right magnification 75
   Magnification for cameras 75
   Magnification in laser-scanning microscopes 76
5. Light sources and fluorochromes 77

6. Light detectors 78
   Photomultipliers 78
   Photodiodes 80
   Avalanche photodiodes 81
   Television cameras 81
   Vidicon tube 82
   SIT cameras 82
   CCD cameras 82
   Video-rate CCDs and readout noise 84
   Long integration CCDs 85
   ICCDs 85
   CMOS cameras 87
   Camera-based spectral imaging 87
   Testing cameras 88

7. Scanning optical microscopes 88
   Advantages of scanning per se 88
Contents

Confocal microscopes 89
Confocal microscopes where a single spot of light is scanned 89
Acousto-optic scanning 93
Parallel confocal microscopes (multi-spot or slit scanners) 94
How to test a confocal microscope 97
Choosing an objective lens 97
Does a confocal microscope have better resolution than a conventional one? 98
How are the lateral and axial resolutions changed by confocal operation? 99
What can be done about chromatic aberration in confocal imaging? 101

Multiphoton imaging 102
How do multiphoton optics differ from confocal? 102
Apparatus for multiphoton imaging 104
Pros and cons of multiphoton versus confocal imaging 104

8. How to choose a fluorescence imaging system 105

Acknowledgements 106

References 106

5. Fluorescence microscopy of living vertebrate cells 109

Rainer Pepperkok and David Shima

1. Introduction 109

2. Hardware and software requirements 110
Microscopes and associated hardware 111
3D sectioning microscope 111
Confocal laser-scanning microscopes 112
Imaging detectors for 3D sectioning microscopy 112
CCD cameras 113
Intensified CCD cameras 115
Colour cameras 115
Temperature and environmental control 116
Data analysis, image processing and data presentation 116

3. Fluorescent labelling of molecules and organelles in living cells 117
Cell-permeable markers 117
Labelling by micro-injection of fluorescently labelled proteins or antibodies 117
Fluorescent labelling of proteins 118
Micro-injection of fluorescently labelled markers 121

4. Utilizing GFP and its variants in live-cell fluorescence microscopy 123

### 6. Visualizing fluorescence in *Drosophila*—optimal detection in thick specimens  
*Ilan Davis*

1. Introduction                                                       | 133  |
2. Spread of light from a point source                                 | 134  |
   - Basic properties of objective lenses                               | 134  |
   - Classes of objective lens                                          | 135  |
   - Resolution and brightness of objective lenses                      | 135  |
   - Optical aberrations and their correction                           | 136  |
   - Measuring the spread of light within a specimen                    | 139  |
   - Determining the point-spread function of a particular lens and microscope configuration | 140  |
   - Using a point-spread function to measure resolution and optical aberrations | 142  |
   - Minimizing spherical aberration by varying the refractive index of the immersion oil | 144  |
3. Imaging fluorescent signals in fixed *Drosophila* embryos and egg chambers | 146  |
   - Difficulties imaging fluorescent signal inside a biological specimen | 146  |
   - Mounting fixed *Drosophila* embryos and egg chambers               | 147  |
   - Choosing the correct mounting medium                               | 148  |
4. Re-assigning or removing out-of-focus light                          | 149  |
   - Deconvolution: basic principles                                     | 150  |
   - Deconvolution: practical considerations                             | 151  |
   - Deconvolution of images from thick specimens                        | 152  |
   - Incomplete deconvolution and deconvolution artefacts                | 152  |
5. Time-lapse microscopy of living *Drosophila* embryos and egg chambers expressing GFP markers or micro-injected with fluorescent reagents | 153  |
   - Mounting, micro-injecting and imaging living embryos                | 153  |
   - Fixing micro-injected *Drosophila* embryos                         | 155  |
   - Fixing GFP-expressing embryos                                      | 156  |
Contents

Preparation, mounting and imaging living egg chambers 157
Choice of expression vectors 158
Choice of GFP mutants 158
Choice of filter cubes 160
