CONTENTS

2 Selecting probes with high brightness 35
   Spectral considerations 37
3 Fluorescence lifetime imaging microscopy (FLIM) 38
4 Fluorescence polarization anisotropy 38
5 Fluorescence resonance energy transfer (FRET) 38
6 Photobleaching and fluorescence redistribution after photobleaching (FRAP) 39
7 Optimization of fluorescent systems for live cell imaging 40
   Selection of the excitation wavelength 41
   The dichroic mirror 41
   Selection of the emission wavelength 41
   Choice of measurement system 42
8 Securing the specimen for microscopy 43
9 Perfusion systems 45
10 Loading strategies for plant cells 46
   Extracellular and permeant intracellular dyes 46
   Ester loading 47
   Low pH loading 48
   Cutinase pre-treatment and low pH loading 49
   Electroporation 50
   Loading via detergent permeabilization 50
   Loading tissues with phloem-mobile probes 50
11 Intracellular dye concentrations, viability, and toxicity 53
12 Selection and use of fluorescent probes 54
   Vital stains 55
   Mortal stains 56
   Cell permeant nuclear stains 57
   Chloroplasts 57
   Mitochondria 58
   Vacuoles 60
   Endoplasmic reticulum 62
   Golgi 62
   Cytoskeleton 63
   The plasma membrane and endocytosis 64
   The cell wall 65
13 Physiological probes 66
   Calcium 66
   Measurement of apoplastic, cytoplasmic, and vacuolar pH 72
   Potassium 76
   Aluminium 76
   Measurement of cytoplasmic glutathione levels 77
   Reactive oxygen species 77
14 Data analysis 78
   Attenuation correction for optical sections deep into tissues 80
   Acknowledgements 81
   References 81

3 Flow cytometry 85
   Teodoro Coba de la Peña and Spencer Brown
   1 Introduction 85

viii
2 Cytometry demonstrated through cell cycle analyses 86

How to understand monoparametric DNA histograms 87
Developing multiparametric DNA histograms and immunofluorescence 90
Extracting intact plant nuclei 91
Which DNA fluorochrome is appropriate? 94
Running and reading the cytometer 94
BrdU incorporation to identify DNA synthesis by fluorescence quenching 95

3 The particular application of genome size calculation and ‘DNA ploidy’ 99
Terminology 99
Internal or external standards 99
Calculating base composition 100

4 Sorting of protoplasts and cellular organelles 101

5 Tests for cell viability during functional assays 104

6 Conclusion 104
Acknowledgements 104
References 105

4 Transient expression, a tool to address questions in plant cell biology 107
Jane L. Hadlington and Jürgen Denecke

1 Introduction 107

2 Current methods of transient expression 108
Naked DNA transfer 108
Biological vectors 108

3 Application of transient expression 109
Promoter analysis 109
Cell biology and biochemistry 110

4 Practical considerations for cell biologists 111
Naked DNA transfer 112
Measurement of protein secretion and cell retention 116
Large scale transient expression for cell fractionation 118
Specialized applications 122

5 Conclusions 124
References 124

5 The green fluorescent protein (GFP) as reporter in plant cells 127
Jean-Marc Neuhaus and Petra Boevink

1 Introduction 127

2 The green fluorescent protein 127
Structure 127
GFP variants 128

3 GFP as a reporter for gene expression 128

4 GFP as a reporter for protein location 129
Cytoplasm and nucleus 129
Chloroplasts and mitochondria 130
Secretory pathway 130
Viral proteins 131
5 Transformation methods 131
PEG-mediated transient expression in protoplasts 131
Agrobacterium-mediated transient expression in planta 134
Virus-mediated transient expression 136
6 Visualization and microscopy of GFP 140
7 Future perspectives 141
References 141

6 Microinjection 143
Michael Knoblauch
1 Introduction 143
2 Equipment 143
   Environment and injection-table 143
   Microscope 144
   Objectives 144
   Glass capillaries 145
   Tip puller 145
   Micromanipulator 146
3 Injection techniques 146
   Iontophoresis 146
   Pressure injection 146
   The galinstan expansion femtosyringe (GEF) 147
4 Cell types 149
   Epidermal cells 149
   Guard cells and trichomes 150
   Mesophyll cells 150
   Ground parenchyma cells 151
   Sieve elements and companion cells 151
   Algae 152
   Bacteria and organelles 153
   Plant tissue cultures 153
5 Material suitable for injection 154
   Fluorochromes 154
   Dextran conjugates 154
   Proteins and antibodies 155
   Nucleic acids 155
6 Tips to make life easier 155
   The chuck 155
   Syringe to delete air bubbles 156
   Flexible fused silica capillaries 156
   Petri dishes 157
References 157

7 Micromanipulation by laser microbeam and optical tweezers 159
Karl Otto Greulich
1 Introduction 159
2 What are laser microtools? 159
# CONTENTS

3 Physical background 160  
   Generating extreme heat 160  
   Why can light be used to move microscopic objects? 160  

4 How to build laser microtools 161  
   The choice of lasers 161  
   Building a laser microbeam or optical tweezers 162  

5 Applications of laser microbeams in plant biology 163  
   Laser-induced microinjection 163  
   Ablation to study cell fate during plant development 164  
   Preparations of root hairs 165  

6 Applications of optical tweezers to plant biology 166  
   Capturing subcellular organelles for inspection 166  
   Simulating microgravity 167  

7 Conclusion 168  
References 168

8 Electrophysiological methods: monitoring exo- and endocytosis in real time 171  
Gerhard Thiel, Jens-Uwe Sutter, and Ulrike Homann  

1 Introduction 171  

2 Theoretical background 171  
   The membrane is equivalent to a capacitor 171  
   A cell as an equivalent circuit 172  

3 Techniques for the measurement of membrane capacitance 172  
   Square-wave stimulation: time-domain technique 173  
   Saw-tooth stimulation 174  
   Capacitance cancellation 174  
   Sinusoidal excitation 174  

4 Capacitance measurements as an assay for exo- and endocytosis: practical considerations 175  
   What kind of cells can be examined? 176  
   Estimation of the specific capacitance 176  
   Recording of single fusion and fission events 176  
   What kind of information can be extracted from the measurements? 179  
   Macroscopic measurement of membrane capacitance 181  

Acknowledgements 186  
References 187

9 Plant histology 189  
Jackie Spence  

1 Introduction 189  

2 Conventional chemical fixation methods 189  

3 Conventional embedding methods and sectioning 191  
   Embedding in a matrix 192  
   Frozen sections 194
CONTENTS

4 Conventional staining methods 195
   General tissue stains 195
   Cell wall stains 197
   Carbohydrate and starch stains 200
   Lipid stains 201
   Nucleic acid stains 202
   Miscellaneous staining methods 203

10 Immunocytochemistry for light microscopy 207
   Béatrice Satiat-Jeunemaitre and Chris Hawes
   1 Introduction 207
   2 Principles and use of immunocytochemistry 208
      Direct and indirect immunostaining 208
      The antibody-antigen complex 208
      Whole molecules or fragments 209
      Polyclonal and monoclonal antibodies 211
      When to perform in situ immunoreaction 214
      Antibodies to epitope tags 215
   3 Basic methods for immunostaining 215
      Preparing plant material 216
      Attaching material to slides and coverslips 220
      Accessing epitopes in cells 220
      Counterstaining and mounting 230
      Interpreting the immunostaining pattern 230
   4 Multiple staining 231
      Multiple immunostaining 231
      Combining immunostaining with other affinity techniques 231
   5 Conclusion 232
   References 232

11 Electron microscopy 235
   Chris Hawes and Béatrice Satiat-Jeunemaitre
   1 Introduction 235
   2 Transmission electron microscopy 235
      Conventional methods 235
      Low temperature methods 250
      Rotary shadowing of proteins 257
   3 Scanning electron microscopy 258
      Ambient temperature SEM 258
      Low temperature SEM 262
      Immuno-SEM 263

12 In situ hybridization 267
   A. R. Leitch, K. Y. Lim, D. R. Webb, and G. I. McFudden
   1 Introduction 267

xii
## CONTENTS

2 Applications of *in situ* hybridization 269  
   DNA:DNA *in situ* hybridization 269  
   RNA:RNA *in situ* hybridization 269  

3 Background to the methods 269  

4 Chromosome preparation for DNA:DNA *in situ* hybridization 270  
   Animal material 270  
   Plant material 271  

5 Material preparation for RNA:RNA *in situ* hybridization 273  
   Specimen preparation 273  
   Controls 275  

6 Labelling the nucleic acids 276  
   DNA labelling 276  
   Checking probe incorporation 282  

7 Material pre-treatment 283  
   Pre-treatment for DNA:DNA *in situ* hybridization 283  
   Pre-treatment for RNA:RNA *in situ* hybridization 284  

8 *In situ* hybridization reaction 285  
   DNA:DNA *in situ* hybridization 285  
   RNA:RNA *in situ* hybridization 286  

9 Post-hybridization washes 287  
   Washes for DNA:DNA *in situ* hybridization 288  
   Washes for RNA:RNA *in situ* hybridization 288  

10 Probe detection and visualization 289  

11 Visualization 290  
   Epifluorescence microscopy 290  
   Image capture 291  
   Image manipulation 292  

References 292  

13 **Organelle isolation** 295  
   David G. Robinson and Giselbert Hinz  

1 Introduction 295  

2 General methodology 295  
   Homogenizing media 295  
   Methods of homogenization 298  
   Methods of organelle separation 299  

3 Isolation of chloroplasts 300  

4 Isolation of mitochondria 300  

5 Isolation of nuclei 301  

6 Isolation of microbodies 303  

7 Isolation of plasma membrane 304  

8 Isolation of tonoplast 306  

9 Isolation of endoplasmic reticulum 308  

10 Isolation of Golgi apparatus 310  

11 Isolation of transport vesicles 312
