About the companion website ............................................................. xix

### 1 Product considerations: medicinal formulations

#### 1 Historical perspective

1.1 Landmarks ....................................................................................... 5
1.2 Significant discoveries ....................................................................... 7
1.3 Difficulties ....................................................................................... 8
1.4 Traditional uses ................................................................................ 10
1.5 Product regulation ........................................................................... 13

#### 2 What is an emulsion?

2.1 States of matter ............................................................................... 24
2.2 Summary thermodynamics .............................................................. 34
2.3 Interfacial tension and wetting .......................................................... 36
2.4 Shear and size reduction ................................................................. 46
2.5 Raw materials .................................................................................. 47

#### 3 Stability, metastability and instability

3.1 Stokes’ law ...................................................................................... 51
3.2 Derjaguin–Landau–Verwey–Overbeek (DLVO) theory ....................... 52
3.3 Interfacial rheology ......................................................................... 56

#### 4 Manufacture

4.1 Premixing ....................................................................................... 63
4.2 High-shear mixers and size reduction ................................................ 64
4.3 Multiple and microemulsions ............................................................ 65
4.4 Hot melt (steriles) 65
4.5 Filling 66

II Forms, uses and applications: biopharmaceuticals 67

5 Creams and ointments 69
5.1 Nutraceuticals and cosmeceuticals 71
5.2 Medicinals 71

6 Pastes and bases 77
6.1 Emolliency 77
6.2 Suppositories 78
6.3 Pessaries 79

7 IV colloids 81
7.1 Needle free 86
7.2 Ocular therapy 87
7.3 Cancer 88
7.4 Antimicrobials 90
7.5 Temperature-sensitive matrices and release forms 93
7.6 Targeted endosomal use 94
7.7 Solid lipid nanoparticles 95
7.8 Diagnostic emulsions 98

8 Transdermal patches: semisolids 99
8.1 Hormones 104
8.2 Analgesia 104
8.3 Anaesthesia 104
8.4 Nicotine 105
8.5 Inserts: vaginal rings 105

9 Gels 107
9.1 Micro- and nanogels 107
9.2 Semisolids 107

10 Implants 109
10.1 Plastics and glasses 109
10.2 Thermoresponsive materials 110

11 De novo science, sustainable novel products and platform applications 111
11.1 Tablets 113
11.2 Metered-dose inhalers 113
11.3 Blood substitutes 114
III Tests: chemistry to control the quality, efficacy and fitness for purpose of a product 117

12 Physicochemical properties 119
    12.1 Thermal evaluation (differential scanning calorimetry) and lipid polymorphs 124
    12.2 Drug form, log $P$ and Lipinski rules 129
    12.3 Skin and epithelial models 133
    12.4 Drug delivery routes 134

13 Sizing and microscopy 137
    13.1 ζ-potential 137
    13.2 Hydrodynamic diameter 139

14 Rheology, texture, consistency and spreadability 141
    14.1 Bulk properties 141
    14.2 Solid-state and nanorheological properties 144
    14.3 Interfacial properties 144

15 Quality control, process analytical technology and accelerated testing 149
    15.1 Preformulation, high-throughput screening 150
    15.2 Industrial concerns 151
    15.3 Rancimat and other methods 152
