Contents

Preface	iii
Introduction	1
Basic Definitions and Notation	7
Organization and Numeration	10
Chapter 1. First-Order Equations	11
1.1 The Cauchy Problem for Quasilinear Equations	11
<i>a. An Example: The Transport Equation. b. The Method of Char-</i>	
<i>acteristics. c. Semilinear Equations. d. Quasilinear Equations.</i>	
<i>e. General Solutions.</i>	
1.2 Weak Solutions for Quasilinear Equations	23
<i>a. Conservation Laws and Jump Conditions. b. Fans and Rar-</i>	
<i>efaction Waves. c. Application to Traffic Flow.</i>	
1.3 General Nonlinear Equations	29
<i>a. The Method of Characteristics. b. Complete Integrals and Gen-</i>	
<i>eral Solutions. c. Application to Geometrical Optics.</i>	
1.4 Concluding Remarks on First-Order Equations	
Chapter 2. Principles for Higher-Order Equations	43
2.1 The Cauchy Problem	43
<i>a. The Normal Form. b. Power Series and the Cauchy-Kovalevski</i>	
<i>Theorem. c. The Lewy Example.</i>	
2.2 Second-Order Equations in Two Variables	49
<i>a. Classification by Characteristics. b. Canonical Forms and Gen-</i>	
<i>eral Solutions. c. First-Order Systems. d. Application to the</i>	
<i>Telegraph System.</i>	
2.3 Linear Equations and Generalized Solutions	59
<i>a. Adjoint and Weak Solutions. b. Transmission Conditions.</i>	
<i>c. Distributions. d. Convolutions and Fundamental Solutions.</i>	
Chapter 3. The Wave Equation	74
3.1 The One-Dimensional Wave Equation	74
<i>a. The Initial Value Problem. b. Weak Solutions. c. Initial/</i>	
<i>Boundary Value Problems. d. The Nonhomogeneous Equation.</i>	
3.2 Higher Dimensions	83
<i>a. Spherical Means. b. Application to the Cauchy Problem. c. The</i>	
<i>Three-Dimensional Wave Equation. d. The Two-Dimensional</i>	
<i>Wave Equation. e. Huygens' Principle.</i>	
3.3 Energy Methods	91
<i>a. Conservation of Energy. b. The Domain of Dependence.</i>	
3.4 Lower-order Terms	95
<i>a. Dispersion. b. Dissipation. c. The Domain of Dependence.</i>	

Chapter 4. The Laplace Equation	100
4.1 Introduction to the Laplace Equation	100
<i>a. Separation of Variables. b. Boundary Values and Physics.</i>	
<i>c. Green's Identities and Uniqueness. d. Mean Values and the</i>	
<i>Maximum Principle.</i>	
4.2 Potential Theory and Green's Functions	108
<i>a. The Fundamental Solution and Potentials. b. Green's Func-</i>	
<i>tion and the Poisson Kernel. c. The Dirichlet Problem on a</i>	
<i>Half-Space. d. The Dirichlet Problem on a Ball. e. Properties</i>	
<i>of Harmonic Functions.</i>	
4.3 General Existence Theory	120
<i>a. Subharmonic Functions. b. Perron's Method.</i>	
4.4 Eigenvalues of the Laplacian	126
<i>a. Eigenvalues and Eigenfunction Expansions. b. Application to</i>	
<i>the Wave Equation.</i>	
Chapter 5. The Heat Equation	134
5.1 The Heat Equation in a Bounded Domain	134
<i>a. Existence by Eigenfunction Expansion. b. The Maximum Prin-</i>	
<i>ciple and Uniqueness.</i>	
5.2 The Pure Initial Value Problem	138
<i>a. Fourier Transform. b. Solution of the Pure Initial Value Prob-</i>	
<i>lem. c. The Fundamental Solution. d. The Nonhomogeneous</i>	
<i>Equation.</i>	
5.3 Regularity and Similarity	146
<i>a. Smoothness of Solutions. b. Scale Invariance and the Similarity</i>	
<i>Method.</i>	
Chapter 6. Linear Functional Analysis	152
6.1 Function Spaces and Linear Operators	152
<i>a. Banach and Hilbert Spaces. b. Sobolev Spaces. c. Linear Op-</i>	
<i>erators and Functionals. d. The Hahn-Banach and Riesz Repre-</i>	
<i>sentation Theorems.</i>	
6.2 Application to the Dirichlet Problem	163
<i>a. Weak Solutions of the Poisson Equation. b. Weak Solutions of</i>	
<i>the Stokes Equations. c. More General Operators in Divergence</i>	
<i>Form. d. The Lax-Milgram Theorem.</i>	
6.3 Duality and Compactness	171
<i>a. Dual Spaces. b. Weak Convergence. c. Compactness.</i>	
6.4 Sobolev Imbedding Theorems	176
<i>a. The Sobolev Inequality for $p < n$. b. The Sobolev Imbedding</i>	
<i>Theorem for $p < n$. c. The Sobolev Inequality and Imbedding</i>	
<i>Theorem for $p > n$. d. Proof of the Sobolev Inequality for $p < n$.</i>	
6.5 Generalizations and Refinements	183
<i>a. Hölder Continuity. b. Mollifiers and Smooth Approximations.</i>	
<i>c. Compact Imbeddings of $H_0^{1,p}(\Omega)$. d. Imbeddings of $H^{1,p}(\Omega)$.</i>	
<i>e. Higher-Order Sobolev Spaces and Strong Solutions.</i>	

Chapter 7. Differential Calculus Methods	199
7.1 Calculus of Functionals and Variations	199
<i>a. The Derivative and Critical Points of a Functional. b. Coercive Functionals and Absolute Extrema. c. Convexity and Uniqueness. d. Mountain Passes and Saddle Points.</i>	
7.2 Optimization with Constraints	209
<i>a. Lagrange Multipliers. b. Application to Eigenvalues of the Laplacian. c. The Maximin Characterization of Eigenvalues.</i>	
7.3 Calculus of Maps between Banach Spaces	218
<i>a. The Method of Successive Approximations. b. The Inverse Function Theorem. c. The Implicit Function Theorem. d. C^1-maps on Sobolev spaces. e. Application to Small Mean Curvature.</i>	
Chapter 8. Linear Elliptic Theory	225
8.1 Elliptic Operators on a Torus	225
<i>a. Fourier Analysis. b. A Priori Estimates and Regularity. c. L^p and Hölder Estimates.</i>	
8.2 Estimates and Regularity on Domains	233
<i>a. Interior Estimates. b. Difference Quotients. c. Interior Regularity of Weak Solutions. d. Global Estimates and Regularity.</i>	
8.3 Maximum Principles	241
<i>a. The Weak Elliptic Maximum Principle. b. Application to A Priori Estimates. c. The Strong Elliptic Maximum Principle. d. Application to the Principal Eigenvalue.</i>	
8.4 Solvability	248
<i>a. Uniqueness and Solvability. b. Fredholm Solvability.</i>	
Chapter 9. Two Additional Methods	258
9.1 Schauder Fixed Point Theory	258
<i>a. The Brouwer Fixed Point Theorem. b. The Schauder Fixed Point Theorem. c. The Leray-Schauder Fixed Point Theorem. d. Application to Stationary Navier-Stokes.</i>	
9.2 Semigroups and Dynamics	264
<i>a. Finite-Dimensional Dynamics. b. Linear Evolution on Banach Spaces. c. The Nonhomogeneous Equation. d. Weak Solutions and Energy Methods. e. Nonlinear Dynamics.</i>	
Chapter 10. Systems of Conservation Laws	283
10.1 Local Existence for Hyperbolic Systems	283
<i>a. Linear Systems. b. Nonlinear Systems.</i>	
10.2 Quasilinear Systems of Conservation Laws	287
<i>a. Examples and Applications. b. Simple Waves and Rarefaction. c. Shocks and the Entropy Condition. d. Riemann Problems.</i>	
10.3 Systems of Two Conservation Laws	301
<i>a. Riemann Invariants. b. The Hodograph Transformation. c. Application to Gas Dynamics.</i>	

Chapter 11. Linear and Nonlinear Diffusion	308
11.1 Parabolic Maximum Principles	308
<i>a. The Weak Parabolic Maximum Principle. b. The Strong Parabolic Maximum Principle. c. Comparison Principles.</i>	
11.2 Local Existence and Regularity	314
<i>a. Pure Initial Value Problems. b. Initial/Boundary Value Problems. c. Additional Smoothness.</i>	
11.3 Global Behavior	321
<i>a. The Comparison Method. b. Energy Methods for Large Time Existence. c. Energy Methods for Asymptotic Behavior.</i>	
11.4 Applications to Navier-Stokes	327
<i>a. Local Existence by the Semigroup Method. b. Weak Solutions of Navier-Stokes. c. A Priori Estimates. d. Existence of a Weak Solution: Galerkin's Method. e. Further Remarks.</i>	
Chapter 12. Linear and Nonlinear Waves	337
12.1 Symmetric Hyperbolic Systems	337
<i>a. Energy Estimates for Linear Systems. b. Existence for Linear Systems. c. Local Existence for Quasilinear Systems. d. Application to Gas Dynamics.</i>	
12.2 Linear Wave Dynamics	350
<i>a. The Wave Equation in R^n. b. The Klein-Gordon Equation in R^n. c. Equations on Bounded Domains. d. The Schrödinger Equation.</i>	
12.3 Semilinear Wave Dynamics	356
<i>a. Local Existence. b. Global Behavior for Conservative Systems.</i>	
Chapter 13. Nonlinear Elliptic Equations	362
13.1 Perturbations and Bifurcations	362
<i>a. Nonlinear Eigenvalue Problems. b. The Method of Lyapunov-Schmidt. c. Bifurcation from a Simple Eigenvalue.</i>	
13.2 The Method of Sub- and Supersolutions	366
<i>a. Barriers for a Semilinear Equation. b. Monotone Iteration. c. Application with Uniformly Bounded $f(x, u)$. d. Application with $f(x, u)$, Nondecreasing in u.</i>	
13.3 The Variational Method	372
<i>a. A Semilinear Equation and Weak Solutions. b. Application of Lagrange Multipliers. c. Application of the Mountain Pass Theorem. d. Regularity and Positivity.</i>	
13.4 Fixed Point Methods	379
<i>a. Semilinear Equations. b. Quasilinear Equations. c. Local Barriers and Boundary Gradient Estimates. d. Hölder Estimates of De Giorgi and Nash. e. Application to the Minimal Surface Equation.</i>	

Hints & Solutions for Selected Exercises	391
