Table of Contents

Preface ix
List of Contributors xiii
List of Participants xv

Performance and Portability in Parallel Computing: a Weather Forecast View
  Bernardo Rodriguez, Leslie Hart and Tom Henderson 1

The New Canadian Variable-Resolution Model: a Universal Tool to Study
  Atmospheric Phenomena on a Broad Temporal and Spatial Scale
  Sylvie Gravel, Jean Coté, Andrew Staniforth, Michel Roch and Alain Patoine 25

Experiences with Parallel Programming in Meteorology
  Fritz G. Wollenweber 33

Porting the Quasi-Nonhydrostatic Meteorological Model to the Kendall Square
  Research KSR1
  C.F. Baillie, A.E. Mac Donald and S. Sun 43

Automatic Differentiation, Tangent Linear Models, and (Pseudo-) Adjoint
  Christian H. Bischof 59

Iterative Domain Decomposition Algorithms: Theory and Applications
  Y. Cai and I.M. Navon 81

Parallel Computing and Operational Sea-Ice Forecasting
  Jeremy Cook 107

Coupled Ocean-Atmosphere Simulations
  L. Terray and O. Thual 115

First Considerations about Modelling the Ocean General Circulation on MIMD
  Machines by Domain Decomposition Method
  Marc Guyon, Michel Chartier, François-Xavier Roux and Philippe Fraunie 125

Predicibility of the Oceanic Circulations
  Christine Bernier 141

Application of Fifth-Order Compact Upwind Differencing to Moisture Transport
  Equation in AGCM
  Mikhail A. Tolstykh 159
A Parallel Algorithm for Simulation of Long Range Transport of Air Pollution
Roar Skalin and Erik Berge

Multidisciplinary Mathematical Model for Earthquake Prediction Studies
A.S. Alekseev

Basic Functional Representation of Programs for Automatic Differentiation in
the Odyssee System
N. Rostaing-Schmidt and E. Hassold

Translation Tools for High Performance Computing
Matthew T. O'Keefe and Aaron Sawdey

Global Atmospheric and Ocean Modeling on the Connection Machine
Susan R. Atlas

Efficiency of a Number of Processors in Integrating a Global Weather Model
S.K. Dash, M. Periasamy, S. Selvakumar and B. Jha
