CLARENDON PRESS • OXFORD
1996
Contents

1. Review of spectral theory
   1.1 Classical spectral theories       1
   1.2 Local spectral theory            5
   1.3 Multivariable spectral theory    10
   1.4 Summary of the applications contained in the book 16
   1.5 References and comments          18

2. Analytic functional calculus via integral representations 21
   2.1 Parametrized complexes            23
   2.2 The Koszul complex                30
   2.3 Cauchy–Weil systems               35
   2.4 The Cauchy–Weil integral          42
   2.5 Joint spectrum and analytic functional calculus 51
   2.6 Analytic spectral mapping theorems for joint spectra 60
   2.7 References and comments           71

3. Topological homology                     73
   3.1 Tensor products relative to a Fréchet algebra 74
   3.2 Inverse limits                      83
   3.3 Direct limits and duality           91
   3.4 Abstract derived functors           95
   3.5 References and comments             96

4. Analytic sheaves                          98
   4.1 Stein spaces and Stein algebras     98
   4.2 Analytic transversality             103
   4.3 Quasi-coherent analytic sheaves    109
   4.4 Fréchet analytic soft sheaves       115
   4.5 Banach coherent analytic Fréchet sheaves 123
   4.6 References and comments             131

5. Fréchet modules over Stein algebras      133
   5.1 Spectra of analytic Fréchet modules 134
   5.2 Spectral mapping theorem           139
   5.3 References and comments             145
6. Bishop's condition (β) and invariant subspaces 146
   6.1 Spectral decompositions and duality 147
   6.2 Bishop's condition (β) and decomposable resolutions 164
   6.3 Essentially decomposable systems 172
   6.4 Condition (β) and smooth resolutions 176
   6.5 Invariant subspaces 193
   6.6 References and comments 202

7. Applications to function theory 205
   7.1 Division lemmas 205
   7.2 Ideals of differentiable functions 210
   7.3 The maximal ideal space of certain algebras of analytic functions 215
   7.4 A pseudoconvexity criterion 224
   7.5 References and comments 226

8. Spectral analysis on Bergman spaces 228
   8.1 The Gleason problem 228
   8.2 Toeplitz operators with $H^\infty$-symbol 236
   8.3 Analytically invariant subspaces 244
   8.4 Rigidity of Bergman submodules 252
   8.5 References and comments 255

9. Finiteness theorems in analytic geometry 257
   9.1 The Cartan–Serre theorem 257
   9.2 Relative nuclearity and perturbation lemmas 258
   9.3 Grauert's direct image theorem 264
   9.4 Semicontinuity theorems 268
   9.5 References and comments 275

10. Multidimensional index theory 276
    10.1 Fredholm complexes 277
    10.2 Essential Fredholm complexes 283
    10.3 Index theory of commutative tuples of operators 288
    10.4 Riemann–Roch theorem on complex spaces 305
    10.5 References and comments 315

Appendix 1. Locally convex spaces 317
Appendix 2. Homological algebra 329
Appendix 4. Sobolev spaces 341
Bibliography 345
