

# Electron Spectrometry of Atoms using Synchrotron Radiation

VOLKER SCHMIDT

University of Freiburg

# Contents

Dear Reader

xiii

## Part A Background and basic principles

<b>1</b>	<b>Introduction</b>	<b>3</b>
1.1	Theoretical background and general aims	3
1.1.1	Atomic structure	3
1.1.2	Ground state wavefunctions (helium)	7
1.1.3	Dynamics	13
1.2	Basic measurable quantities	16
1.3	Properties of synchrotron radiation	21
1.4	Monochromatization of synchrotron radiation	29
1.5	Basic aspects of electron spectrometry with synchrotron radiation	37
<b>2</b>	<b>Photoelectron spectrum of neon</b>	<b>46</b>
2.1	Theoretical formulation of the photoprocess	46
2.2	Analysis of line position	52
2.3	Analysis of linewidth	54
2.3.1	Level width	56
2.3.2	Convolution of energy distribution functions	62
2.4	Analysis of line intensity	65
2.5	Analysis of angular distribution	69
<b>3</b>	<b>Auger spectrum of neon following 1s ionization</b>	<b>73</b>
3.1	Description of the K-LL Auger spectrum	73
3.1.1	General aspects	73
3.1.2	Calculation of transition rates	77
3.1.3	Intermediate coupling	85
3.2	Analysis of line position	87
3.3	Analysis of linewidth	87
3.4	Analysis of line intensity	88
3.5	Analysis of angular distribution	90

## Part B Experimental aspects and recent examples

<b>4</b>	<b>Experimental aspects</b>	<b>97</b>
4.1	The dispersive element of electron energy analysers	97
4.2	Characteristic features of electrostatic analysers	99

4.2.1	Principal trajectory and focusing properties	99
4.2.2	Energy dispersion and energy resolution	104
4.2.3	Acceptance solid angle, spectrometer transmission, spectrometer function and luminosity	108
4.2.4	Operation modes	113
4.3	Electron detectors (channeltron/channelplate)	117
4.3.1	Performance characteristics	117
4.3.2	A channelplate as a position-sensitive detector	122
4.3.3	Detection efficiency	127
4.4	Electrostatic lenses	131
4.4.1	Basic properties	132
4.4.2	Selected examples	136
4.5	Disturbances of the performance	143
4.5.1	Scattering losses	144
4.5.2	Magnetic fields	149
4.5.3	Electric fields	150
4.5.4	Thermal Doppler broadening	151
4.5.5	Postcollision interaction (PCI)	152
4.6	Electron–electron coincidences	154
4.6.1	Parametrization of the differential cross section for two-electron emission	154
4.6.2	True and accidental coincidences	172
4.6.3	Optimization	178
<b>5</b>	<b>Recent examples</b>	<b>185</b>
5.1	Electron emission around the 4d ionization threshold in xenon	185
5.1.1	Experimental details	186
5.1.2	Specific aspects	190
5.2	2p photoionization in atomic magnesium	197
5.2.1	Observables for 2p photoionization	198
5.2.2	Experimental details and results	202
5.2.3	Comparison of experimental matrix elements with theoretical results from mean-field theories	207
5.2.4	Inclusion of ISCI and FISCI correlations	212
5.3	3s satellite spectrum of argon	215
5.3.1	General background	216
5.3.2	$^2S^e$ manifold treated by FISCI	220
5.3.3	Experimental results from well-resolved spectra	224
5.4	Spin-polarization of $5p_{3/2}$ photoelectrons in xenon	228
5.4.1	Parametrization for spin observation	229
5.4.2	Spin detection by Mott scattering	230
5.4.3	Experimental set-up for spin-dependent measurements	234
5.4.4	Results for $5p_{3/2}$ photoionization	236

5.5	PCI between $4d_{5/2}$ photoelectrons and $N_5-O_{2,3}O_{2,3} {}^1S_0$ Auger electrons in xenon	239
5.5.1	Experimental details	239
5.5.2	Special calibration measurements	240
5.5.3	Results	245
5.6	Angular correlation between $4d_{5/2}$ photoelectrons and $N_5-O_{2,3}O_{2,3} {}^1S_0$ Auger electrons in xenon	247
5.6.1	Experimental details	248
5.6.2	Estimation of true and accidental coincidences	252
5.6.3	Results	254
5.7	Threshold double photoionization in argon	256
5.7.1	Cross section for double photoionization at threshold	257
5.7.2	Experimental details	262
5.7.3	Results	266

### Part C Details of specific experimental and theoretical topics

6	Useful reference data	273
6.1	Atomic units	273
6.2	Some spectroscopic data for calibration purposes	274
7	Wavefunctions	278
7.1	One-electron wavefunctions	278
7.1.1	Wavefunctions of discrete orbitals	278
7.1.2	Plane wavefunction of an electron	280
7.1.3	Wavefunction of an emitted electron	284
7.1.4	Dimension of wavefunctions	289
7.2	Evaluation of determinantal wavefunctions	290
7.2.1	Clebsch–Gordan coefficients	290
7.2.2	Coefficients of fractional parentage	294
7.2.3	Step-up and step-down operators	296
7.2.4	Recoupling coefficients	297
7.3	Hartree–Fock approach	298
7.3.1	Derivation of the HF equation for the helium atom	298
7.3.2	HF equations for the neon atom	305
7.4	Mixing of wavefunctions	306
7.4.1	Configuration interaction and stationary wavefunctions	306
7.4.2	Diagonalization procedure	308
7.4.3	Wavefunctions in $LSJ$ -, intermediate, and $jjJ$ -coupling	310
7.5	Recasting of correlated wavefunctions in helium (ground state)	313
7.5.1	CI approach	313
7.5.2	Hylleraas wavefunction	315

<b>8</b>	<b>Special theoretical aspects</b>	<b>318</b>
8.1	Photon-atom interaction and photoionization matrix elements	318
8.1.1	Interaction operator	318
8.1.2	Dipole approximation	321
8.1.3	Several forms of the dipole matrix element	323
8.2	Different formulations and approximations for photoionization of $np$ -electrons ( $\sigma$ and $\beta$ )	326
8.2.1	Formulation in the approach of angular momentum transfer	326
8.2.2	Formulation using $jjJ$ -coupled dipole matrix elements	328
8.2.3	Approximations towards the Cooper-Zare model	329
8.3	Photon-induced $L_3-M_1M_1$ Auger decay in magnesium described as a one- and a two-step process	331
8.3.1	General formulation as a one-step process	332
8.3.2	One-step formula for a well-defined intermediate state	333
8.3.3	Two-step formula for a well-defined intermediate state	337
8.4	Derivation of angular distributions by means of statistical tensors	340
8.4.1	General idea	340
8.4.2	Some recipes	345
8.4.3	Examples	350
8.5	Angular distribution and alignment of $L_3-M_1M_1$ Auger electrons in magnesium	357
8.5.1	Non-coincident case	357
8.5.2	Auger electrons measured in coincidence with the photo-electron	360
<b>9</b>	<b>Polarization properties</b>	<b>364</b>
9.1	Angular distributions for different light polarizations	364
9.1.1	Individual forms for specific polarizations	364
9.1.2	Common form for arbitrary polarization	365
9.2	Description of electron and photon polarization	366
9.2.1	Polarization of an electron beam	367
9.2.2	Polarization of a photon beam	371
<b>10</b>	<b>Special instrumental aspects</b>	<b>375</b>
10.1	Time-of-flight analysis of electrons	375
10.2	Optical properties of CMAs	378
10.2.1	Electron trajectories	379
10.2.2	Focusing properties	382
10.2.3	Energy dispersion	385
10.3	Supplements for electrostatic lenses	386
10.3.1	Derivation of the fundamental lens equation	386
10.3.2	Liouville theorem and related forms	388

10.4 Convolution procedures	391
10.4.1 General formulation for photon-induced two-electron emission	391
10.4.2 Non-coincident observation of the photoelectron or the Auger electron	393
10.4.3 Coincident observation of the photoelectron and its subsequent Auger electron	394
10.4.4 Convolution of two Gaussian or two Lorentzian functions	399
10.5 Solid-angle corrections	401
10.6 Shielding of the earth's magnetic field	403
10.7 Formation of a gas beam by capillaries	406
10.7.1 General aspects of flowing gases and total rate of flow	407
10.7.2 Spatial distribution of the formed beam	411
10.7.3 Target density of a formed beam	412
References	415
