LANDFILL BIOREACTOR DESIGN AND OPERATION

Debra R. Reinhart
Timothy G. Townsend

LEWIS PUBLISHERS
Boca Raton New York
## CONTENTS

### Chapter 1 — Introduction
- Scope and Objectives .................................................. 1
- The Evolution of Landfills for Waste Management .............. 2
- Landfills as Bioreactors ............................................... 3
- Regulatory Status ...................................................... 4
- Organization of the Book ............................................ 5

### Chapter 2 — Modern Landfill Fundamentals
- Introduction .............................................................. 7
- Overview of Modern Sanitary Landfills ......................... 7
- Landfill Containment Systems ..................................... 9
  - Compacted Soil Barrier Layers .................................. 10
  - Synthetic Barrier Layers .......................................... 10
  - Liner Systems ....................................................... 11
  - Cap Systems ........................................................ 12
- Collection and Control of Leachate ............................. 13
- Leachate Generation ................................................. 13
- Leachate Collection and Storage .................................. 14
- Leachate and Gas Management at MSW Landfills ............. 15
  - The Landfill as a Biological System ......................... 16
  - Characteristics of Leachate ..................................... 18
  - Leachate Treatment and Disposal .............................. 20
  - Characteristics and Generation of Landfill Gas .......... 20
  - Landfill Gas Control ............................................. 21
  - Waste Decomposition and Landfill Settlement ............ 22
- Landfill Operation Strategies .................................... 23

### Chapter 3 — Landfill Bioreactor Studies
- Laboratory Scale Studies .......................................... 25
  - Georgia Institute of Technology Experiment I ............... 25
  - University of Louisville Experiment .......................... 27
  - Federal Republic of Germany Experiment .................... 28
  - Newcastle University Experiment .............................. 30
  - Georgia Institute of Technology Experiment II ............. 31
- Pilot-Scale Bioreactor Studies ................................... 32
  - Sonoma County, California ....................................... 32
  - Georgia Institute of Technology Study ...................... 33
  - Mountain View Landfill, California ......................... 36
  - Binghamton, New York ........................................... 37
  - Breitenau Landfill, Australia .................................. 38
  - Broghborough, United Kingdom ................................ 43
  - SORAB Test Cells ................................................. 45
- Full-Scale Landfill Bioreactor Studies ......................... 45
  - Lycoming County, Pennsylvania ............................... 45
  - Seamer Carr Landfill, United Kingdom ....................... 52
Chapter 4 — Full-Scale Experiences with Bioreactor Landfills — Case Studies

Introduction
Southwest Landfill, Alachua County, Florida
Central Facility Landfill, Worcester County, Maryland
Winfield Landfill, Columbia County, Florida
Pecan Row Landfill, Lowndes County, Georgia
Lower Mount Washington Valley Secure Landfill, Conway, New Hampshire
Coastal Regional Solid Waste Management Authority Landfill, Craven County, North Carolina
Lemons Landfill, Stoddard County, Missouri
Mill Seat Landfill, Monroe County, New York
Yolo County Landfill, California
Additional Full-Scale Efforts

Chapter 5 — The Hydrodynamics of Leachate Recirculating Landfills

Introduction
Leachate Generation
Leachate Quality
Predicting Leachate Quality
Internal Storage of Leachate
Moisture Movement
Unsaturated Leachate Flow
Unsaturated Flow Characteristics
Values of Saturated Hydraulic Conductivity in Landfills
Mathematical Modeling of Leachate Recirculation
Trench Modeling
Vertical Infiltration Well Modeling
Model Results
Leachate Recirculation Field Testing

Chapter 6 — The Impact of Leachate Recirculation of Leachate and Gas Characteristics

Introduction
Leachate Characteristics of Recirculating Landfills
Fate and Transport of Priority Pollutants
Comparison of Waste Stabilization Rates
Leachate Treatment Implications
Leachate Quantities
Gas Production

Chapter 7 — Landfill Bioreactor Design

Introduction
Liner/Leachate Collection System
Leachate Storage
Impact of Storage on Offsite Leachate Management
Storage Sizes
Leachate Reintroduction Systems
Prewetting of Waste
Leachate Spraying
Surface Ponds
Vertical Injection Wells
Horizontal Subsurface Introduction
Leachate Recirculation System Design
Horizontal Trenches
Vertical Recharge Wells
Design Approach
Final and Intermediate Caps
Gas Collection
Cell Construction
Construction Costs
Summary

Chapter 8 — Landfill Bioreactor Operation
Introduction
Waste Characterization
Waste Composition
Waste Physical Properties
Oxidation Reduction Conditions
Moisture Content
Recirculation Strategies
Leachate Recirculation Frequency
Extent of Leachate Recirculation
Effects of Waste Placement Rate
Use of Old Cells
Bioreactor Augmentation
Temperature Control
Nutrients
Buffering
Inoculation
Daily and Intermediate Covers
Settlement
Monitoring
When is the Waste Stable?

Chapter 9 — Materials Recovery and Reuse from Bioreactor Landfills
Introduction
Landfill Treatment and Reclamation Strategies
Benefits of Bioreactor Landfill Treatment and Reclamation
Conceptual Operation Approach
Mass Balance Design for Landfill Reclamation
Bioreactor Landfill Unit Sizing
The Amount and Composition of Reclaimed Material
