A Problem-Solving Approach to Aquatic Chemistry

James N. Jensen
University at Buffalo
## Table of Contents

### Part I: Fundamental Concepts  1

**Chapter 1: Getting Started with the Fundamental Concepts  3**

1.1 Introduction  3  
1.2 Why Calculate Chemical Species Concentrations?  3  
1.3 Master Variables: The Importance of pH and pe  7  
1.4 Properties of Water  8  
1.5 Part I Road Map  9  
1.6 Summary  10  
1.7 Part I Case Study: Can Methylmercury Be Formed in Water?  10  
Summary of Key Ideas  12

**Chapter 2: Concentration Units  13**

2.1 Introduction  13  
2.2 Units Analysis  13  
2.3 Molar Concentration Units  14  
2.4 Mass Concentration Units  18  
2.5 Dimensionless Concentration Units  21  
2.6 Equivalents  22  
2.7 Review of Units Interconversion  23  
2.8 Common Concentration Units in the Gas Phase  23  
2.9 Common Concentration Units in the Solid Phase  25  
2.10 Activity  25  
2.11 Summary  27  
2.12 Part I Case Study: Can Methylmercury Be Formed in Water?  27  
Summary of Key Ideas  28  
Historical Note: Amadeo Avogadro and Avogadro’s Number  29  
Problems  30

**Chapter 3: Thermodynamic Basis of Equilibrium  33**

3.1 Introduction  33  
3.2 Thermodynamic Properties  34  
3.3 Why Do We Need Thermodynamics to Calculate Species Concentrations?  37  
3.4 Thermodynamic Laws  41  
3.5 Gibbs Free Energy  44  
3.6 Properties of Thermodynamic Functions  46  
3.7 Changes in Thermodynamic Properties During Chemical Reactions  49  
3.8 Relating Gibbs Free Energy to Species Concentrations  54  
3.9 Chemical Equilibrium and the Equilibrium Constant  59  
3.10 Summary  60  
3.11 Part I Case Study: Can Methylmercury Be Formed in Water?  61  
Summary of Key Ideas  62  
Historical Note: Josiah Willard Gibbs  63  
Problems  63
Chapter 4: Manipulating Equilibria 67
4.1 Introduction 67
4.2 Chemical and Mathematical Forms of Equilibrium 68
4.3 Units of Equilibrium Constants 70
4.4 Reversing Equilibria 72
4.5 Effects of Stoichiometry 73
4.6 Adding Equilibria 75
4.7 Creating Equilibria 76
4.8 Summary 82
4.9 Part I Case Study: Can Methylmercury Be Formed in Water? 82
Summary of Key Ideas 83
Historical Note: Henri-Louis Le Chatelier and Le Chatelier's Principle 84
Problems 85

Part II: Solution of Chemical Equilibrium Problems 87

Chapter 5: Getting Started with the Solution of Chemical Equilibrium Problems 89
5.1 Introduction 89
5.2 A Framework for Solving Equilibrium Problems 89
5.3 Introduction to Defining the Chemical System 91
5.4 Introduction to Enumerating Chemical Species 92
5.5 Introduction to Defining the Constraints on Species Concentrations 92
5.6 Road Map to Part II 94
5.7 Summary 95
5.8 Part II Case Study: Have You Had Your Zinc Today? 95
Summary of Key Ideas 96

Chapter 6: Setting Up Chemical Equilibrium Problems 97
6.1 Introduction 97
6.2 Defining the Chemical System 97
6.3 Enumerating Chemical Species 98
6.4 Defining Constraints on Species Concentrations 104
6.5 Review of Procedures for Setting Up Equilibrium Systems 111
6.6 Concise Mathematical Form for Equilibrium Systems: An Advanced Topic 112
6.7 Summary 113
6.8 Part II Case Study: Have You Had Your Zinc Today? 113
Summary of Key Ideas 117
Problems 117

Chapter 7: Algebraic Solution Techniques 121
7.1 Introduction 121
7.2 Background on Algebraic Solutions 121
7.3 Method of Substitution 123
7.4 Method of Approximation 126
7.5 Summary 133
7.6 Part II Case Study: Have You Had Your Zinc Today? 134
Summary of Key Ideas 137
Problems 138
Part VI: Beyond Dilute Systems at Equilibrium 459

Chapter 20: Getting Started with Beyond Dilute Systems at Equilibrium 461
  20.1 Introduction 461
  20.2 Extensions to Nonideal and Nonstandard Conditions 461
  20.3 Nonequilibrium Conditions 464
  20.4 Integrated Case Studies 465
  20.5 Part VI Road Map 465
  20.6 Summary 466
  Summary of Key Ideas 466

Chapter 21: Thermodynamics Revisited 467
  21.1 Introduction 467
  21.2 Effects of Ionic Strength 468
  21.3 Effects of Temperature on Chemical Equilibria 479
  21.4 Effects of Pressure on Equilibrium Constants 484
  21.5 Summary 486
  Summary of Key Ideas 487
  Historical Note: Jacobus Henricus Van’t Hoff 488
  Problems 488

Chapter 22: Chemical Kinetics of Aquatic Systems 491
  22.1 Introduction 491
  22.2 The Need for Chemical Kinetics 492
  22.3 Reaction Rates 494
  22.4 Common Rate Expressions 500
  22.5 More Complex Kinetic Forms 506
  22.6 Effects of Temperature and Ionic Strength on Reaction Kinetics 511
  22.7 Summary 514
  Summary of Key Ideas 515
  Problems 516

Chapter 23: Putting It All Together: Integrated Chemistry of Aquatic Systems 519
  23.1 Introduction 519
  23.2 Integrated Case Study 1: Metal Finishing 519
  23.3 Integrated Case Study 2: Oxidation of Ferrous Iron by Oxygen 524
  23.4 Integrated Case Study 3: Inorganic Mercury Chemistry in Natural Waters 529
  23.5 Summary 535

Appendices 537

Appendix A: Background Information 537
  A.1 Introduction 537
  A.2 Chemical Principles 537
  A.3 Mathematical Principles 540
  A.4 Computer Skills 540
  Summary of Key Ideas 542

Appendix B: Equilibrium and Steady State 543
  B.1 Introduction 543
  B.2 Steady-State Analysis 543
