

Variable C:N Ratios of Particulate Organic Matter and Their Influence on the Marine Carbon Cycle

Variable C:N-Verhältnisse von partikulärem organischen Material und deren Einfluß auf den marinen Kohlenstoffhaushalt

Contents

Zusammenfassung	iii
Summary	v
1 Introduction	1
1.1 Marine Biogeochemistry	1
1.2 Particulate Organic Matter (POM)	6
1.3 Element Ratios	7
1.4 Objectives	11
2 Elemental Composition of POM: Data Analysis	12
2.1 The Data Set	12
2.2 General Trend	15
2.3 C:N Depth Dependence	17
2.4 Lithogenic Contribution	20
2.5 Temporal Changes	24
3 Variable Element Ratios of POM: Explanations	32
3.1 Methodological Discussion	32
3.1.1 Filter Samples	32
3.1.2 Sediment Trap Samples	33
3.1.3 Comparison between Sediment Trap and Filter Samples	34
3.1.4 Comparison with Results from Dissolved Nutrient Fields	35
3.2 Processes influencing Particle Composition	38
3.2.1 Preferential Remineralization	38
3.2.2 Nutrient Availability	40
3.2.3 Lithogenic Material	43
3.2.4 Changes in Species Composition	44
3.2.5 Transparent Exopolymer Particles (TEP)	45

4	Depth Dependent Element Ratios in a Global Carbon Cycle Model	47
4.1	Implications for Biogeochemical Modeling	47
4.2	The AAMOC Model	48
4.3	The Experiments	54
4.4	Model Results	60
4.4.1	Steady State Experiments	60
4.4.2	Time Dependent Simulations	63
5	Implications for the Marine Carbon Cycle	72
5.1	Ocean Carbon Inventory and Uptake of Anthropogenic CO ₂	72
5.2	Variable Element Ratios of POM and Global Change	78
6	Outlook	82
	Acknowledgements	84
