Biodiversity in Britain’s Planted Forests

Results from the Forestry Commission’s Biodiversity Assessment Project

Jonathan Humphrey, Richard Ferris and Chris Quine
Contents

Editors and contributors  iv

Preface  v

Section One: Introduction and context
1. Introduction: the policy context for biodiversity  3
   Tim Rollinson
2. An introduction to biodiversity research  7
   Chris Quine
3. The biodiversity assessment project: objectives, site selection and survey methods  11
   Jonathan Humphrey, Richard Ferris and Andrew Peace
4. The use of multivariate statistics – a brief introduction  19
   Andrew Peace

Section Two: Plant, fungal and microbial communities
5. Relationships between site type, stand structure and plant communities  25
   Jonathan Humphrey, Richard Ferris and Andrew Peace
6. Soil microbial communities  31
   Mike Morris, Jim Harris and Tom Hill
7. Deadwood  41
   Jonathan Humphrey and Andrew Peace
8. The value of conifer plantations as a habitat for macrofungi  51
   Jonathan Humphrey, Richard Ferris, Andrew Newton and Andrew Peace
9. Lichen and bryophyte communities: the influence of site type, stand structure and deadwood  63
   Jonathan Humphrey, Simon Davey, Andrew Peace, Richard Ferris and Kim Harding

Section Three: Invertebrate and bird communities
10. Invertebrate communities in plantation forests  75
    Martin Jukes and Andrew Peace
11. Effects of plantation structure and management on birds  93
    Rob Fuller and Steven Browne

Section Four: Conclusions
12. The future management of plantation forests for biodiversity  103
    Chris Quine and Jonathan Humphrey

Annexe 1: Details of assessment sites  115

Annexe 2: Methods for extraction and analysis of soil microbial PFLAs  117
