Contents

Preface ................................................................. v

1 Introduction .......................................................... 1
  1.1 The output regulation problem ............................... 1
  1.2 Convergent dynamics .......................................... 4
  1.3 Book outline .................................................... 6

2 Convergent systems .................................................. 9
  2.1 Stability concepts .............................................. 9
    2.1.1 Lyapunov stability ......................................... 9
    2.1.2 Input-to-state stability .................................. 12
  2.2 Convergent systems ............................................ 14
    2.2.1 Basic definitions ......................................... 14
    2.2.2 Convergent systems with inputs ......................... 16
    2.2.3 Basic properties of convergent systems ................ 18
    2.2.4 Sufficient conditions for convergence .................. 22
  2.3 Summary ......................................................... 28

3 The uniform output regulation problem ............................. 31
  3.1 System equations and basic assumptions ...................... 32
  3.2 The uniform output regulation problem ....................... 33
    3.2.1 The global uniform output regulation problem ............ 34
    3.2.2 The local uniform output regulation problem ............. 35
    3.2.3 Types of controllers ..................................... 36
    3.2.4 Robust output regulation ................................ 36
    3.2.5 Properties of the closed-loop system .................... 37
  3.3 Relations to conventional problem settings .................... 37
  3.4 Observer design and controlled synchronization ............... 39
    3.4.1 Observer design problem ................................ 39
    3.4.2 Controlled synchronization problem ....................... 41
  3.5 Summary ......................................................... 41
4 Solvability of the uniform output regulation problem
   4.1 Analysis of the conventional local output regulation problem
   4.2 Invariant manifold theorems
   4.3 \( \omega \)-limit sets
   4.4 Solvability of the global (forward time) uniform output regulation problem
      4.4.1 Solvability of the global uniform output regulation problem
      4.4.2 Solvability of the robust global uniform output regulation problem
      4.4.3 Solvability of the global forward time uniform output regulation problem
   4.5 Solvability of the local uniform output regulation problem
   4.6 Applications of the invariant manifold theorems
      4.6.1 Generalized synchronization
      4.6.2 Nonlinear frequency response functions
   4.7 Summary

5 Controller design for the global uniform output regulation problem
   5.1 Controller design strategy
   5.2 Controller decomposition
   5.3 How to make a system input-to-state convergent?
      5.3.1 Backstepping design
      5.3.2 Quadratic stability design
      5.3.3 Controller design for Lur'e systems
   5.4 Controller design for the global uniform output regulation problem
      5.4.1 State feedback controller design
      5.4.2 Output feedback controller design
      5.4.3 Controller design for Lur'e systems
      5.4.4 Robust controller design for Lur'e systems
   5.5 Summary

6 The local output regulation problem: convergence region estimates
   6.1 Estimates for the local output regulation problem
      6.1.1 Estimation problem statement
      6.1.2 Convergence sets and the Demidovich condition
      6.1.3 Estimation results
      6.1.4 Example: the TORA system
   6.2 Estimates for the approximate local output regulation problem
   6.3 Summary
