# Contents

1 The dielectric permeability

1.1 How the electromagnetic field acts on dust .......................... 1
1.1.1 Electric field and magnetic induction .......................... 1
1.1.2 Electric polarization of the medium .......................... 2
1.1.3 Magnetic polarization of the medium .......................... 6
1.1.4 Free charges and polarization charges ......................... 7
1.1.5 The field equations ........................................... 9
1.1.6 Waves in a dielectric medium .................................. 9
1.1.7 Energy dissipation of a grain in a variable field ............ 12

1.2 The harmonic oscillator ............................................. 13
1.2.1 The Lorentz model ............................................ 14
1.2.2 Dissipation of energy .......................................... 17
1.2.3 Dispersion relation of the dielectric permeability .......... 18
1.2.4 The harmonic oscillator and light ............................ 20
1.2.5 Radiation damping ............................................ 23
1.2.6 The cross section of an harmonic oscillator ................. 24

1.3 Waves in a conducting medium ..................................... 25
1.3.1 The dielectric permeability of a conductor .................. 25
1.3.2 Conductivity and the Drude profile .......................... 27

2 How to evaluate grain cross sections ................................ 29
2.1 Defining cross sections ............................................ 29
2.1.1 Cross section for scattering, absorption and extinction .... 29
2.1.2 Phase function and cross section for radiation pressure .... 31
2.1.3 Efficiencies, mass and volume coefficients .................... 32
2.2 The optical theorem .............................................. 32
2.2.1 The intensity of forward scattered light ...................... 33
2.2.2 The refractive index of a dusty medium ....................... 35
2.3 Mie theory for a sphere ......................................... 37
2.3.1 The formalism .............................................. 37
2.3.2 Scattered and absorbed power ................................ 38
2.4 Polarization and scattering ...................................... 39
2.4.1 The amplitude scattering matrix ............................. 40
2.4.2 Angle-dependence of scattering ............................... 41
2.4.3 The polarization ellipse ..................................... 41
2.4.4 Stokes parameters .......................................... 42

5 Structure and composition of dust 101
  5.1 Crystal structure ........................................... 101
      5.1.1 Translational symmetry ............................... 101
      5.1.2 Lattice types ........................................ 102
      5.1.3 The reciprocal lattice ................................ 105
  5.2 Binding in crystals ........................................ 107
      5.2.1 Covalent and ionic bonding ............................ 107
      5.2.2 Metals ................................................ 108
      5.2.3 van der Waals forces and hydrogen bridges .......... 110
  5.3 Carbonaceous grains and silicate grains ................ 111
      5.3.1 Origin of the two major dust constituents ............ 111
      5.3.2 The bonding in carbon ................................ 112
      5.3.3 Carbon compounds .................................... 113
      5.3.4 Silicates ............................................. 117
      5.3.5 The origin of the elements found in dust grains .... 120
  5.4 Optical constants of dust materials ........................ 121
  5.5 Grain sizes .................................................. 128
      5.5.1 The MRN size distribution ............................ 128
      5.5.2 Collisional fragmentation ............................ 129

6 Dust radiation 131
  6.1 Kirchhoff's law ............................................. 131
      6.1.1 The emissivity of dust ................................ 131
      6.1.2 Thermal emission of grains ........................... 132
      6.1.3 Absorption and emission in thermal equilibrium ...... 133
  6.2 The temperature of big grains .............................. 134
      6.2.1 The energy equation .................................. 134
      6.2.2 Temperature estimates ................................ 135
      6.2.3 Relation between grain size and grain temperature .. 137
      6.2.4 Dust temperatures from observations ................ 138
  6.3 The emission of big grains ................................ 140
      6.3.1 Constant temperature and low optical depth .......... 140
      6.3.2 Total emission and cooling rate of a grain ........ 143
  6.4 Calorific properties of solids .............................. 143
      6.4.1 Traveling waves in a crystal ........................ 145
      6.4.2 Internal energy of a grain ............................ 148
      6.4.3 The Debye temperature ................................ 149
      6.4.4 Specific heat ......................................... 150
      6.4.5 Two-dimensional lattices .............................. 151
  6.5 Temperature fluctuations of very small grains ............ 152
      6.5.1 The probability density $P(T)$ ....................... 153
      6.5.2 The transition matrix ................................ 153
      6.5.3 The stochastic time evolution of grain temperature ... 155
  6.6 The emission spectrum of very small grains ................ 156
      6.6.1 Moderate fluctuations ................................. 156
### 7 Dust and its environment

#### 7.1 Grain charge
- 7.1.1 Charge equilibrium in the absence of a UV field 161
- 7.1.2 The photoelectric effect 163

#### 7.2 Grain motion
- 7.2.1 Random walk 167
- 7.2.2 The drag on a grain subjected to an outer force 167
- 7.2.3 Brownian motion of a grain 170

#### 7.3 Dust in the solar system
- 7.3.1 Interplanetary dust 172
- 7.3.2 The Poynting-Robertson effect 173
- 7.3.3 Electromagnetic forces on grains: Dust from Io 174
- 7.3.4 Shooting stars and less belligerent meteoroids 176

#### 7.4 Grain destruction
- 7.4.1 Mass balance of gas and dust in the Milky Way 181
- 7.4.2 Destruction processes 183

#### 7.5 Grain formation
- 7.5.1 Evaporation temperature and vapor pressure 185
- 7.5.2 Vapor pressure of small grains 187
- 7.5.3 Critical saturation 189
- 7.5.4 Time-dependent homogeneous nucleation 190
- 7.5.5 Steady-state nucleation 191
- 7.5.6 Solutions to time-dependent homogeneous nucleation 195

### 8 Grain surfaces

#### 8.1 Gas accretion on grains
- 8.1.1 Physical adsorption and chemisorption 202
- 8.1.2 The sticking probability 205

#### 8.2 Mobility of atoms on grain surfaces
- 8.2.1 Thermal hopping 207
- 8.2.2 Evaporation 208
- 8.2.3 Tunneling 208
- 8.2.4 Photodesorption 209

#### 8.3 Grain surface chemistry
- 8.3.1 Chemical reactions in the gas 210
- 8.3.2 Chemical reactions on dust 211
- 8.3.3 The formation of H$_2$ in diffuse clouds 214

#### 8.4 Ice mantles 215
Table of Contents

9 PAHs and spectral features of dust 219
  9.1 Polycyclic Aromatic Hydrocarbons 219
  9.1.1 Microcanonic emission of PAHs 220
  9.1.2 An example: anthracene 221
  9.1.3 Photo-excitation of PAHs 224
  9.1.4 Cutoff wavelength for electronic excitation 225
  9.1.5 Photo-destruction and ionization 226
  9.1.6 Cross sections and line profiles of PAHs 227
  9.2 ERE and DIBs 229
  9.3 The silicate bands at 10\(\mu\)m and 18\(\mu\)m 230
    9.3.1 The strength of the resonances 230
    9.3.2 How the bands change with temperature and grain size 231
  9.4 Crystalline silicates 233
    9.4.1 Where they are found and how they form 233
    9.4.2 Thermal expansion of grains 234
    9.4.3 The frequency shift of a resonance in grain heating 236
  9.5 The feature at 3.4\(\mu\)m 237

10 Interstellar reddening and dust models 239
  10.1 Reddening by interstellar grains 239
    10.1.1 Stellar photometry 239
    10.1.2 The interstellar extinction curve 241
    10.1.3 Two-color-diagrams 245
    10.1.4 Spectral indices 246
    10.1.5 The mass absorption coefficient 246
  10.2 Dust models 249
    10.2.1 Description of the model components 250
    10.2.2 Extinction and scattering of the dust model 252
    10.2.3 Extinction and absorption mass coefficients 254

11 Radiative transport 259
  11.1 Basic transfer relations 259
    11.1.1 Definition of intensity, mean intensity and flux 259
    11.1.2 The general transfer equation 262
    11.1.3 Transfer equation in spherical and slab symmetry 264
    11.1.4 Frequency averages 266
    11.1.5 Analytical solutions to the transfer equation 267
  11.2 Spherical clouds 268
    11.2.1 Integral equations for the intensity 269
    11.2.2 Practical hints 270
  11.3 Passive disks 272
    11.3.1 Radiative transfer in a plane parallel layer 272
    11.3.2 Disks of high optical thickness 274
    11.3.3 The grazing angle 275
11.4 Galactic nuclei ........................................... 278
11.4.1 Hot spots in a spherical stellar cluster .............. 278
11.4.2 Low and high luminosity stars ....................... 279
11.5 The pursuit of random photons .......................... 281
11.5.1 The strategy ........................................ 281
11.5.2 Grains with temperature fluctuations ................. 284
11.5.3 Anisotropic scattering .............................. 286
11.5.4 Practical considerations ............................ 287

12 Spectral energy distribution of dusty objects ............. 289
12.1 Early stages of star formation .......................... 289
12.1.1 Globules .......................................... 289
12.1.2 Isothermal gravitationally-bound clumps .............. 291
12.1.3 The density structure of a protostar .................. 292
12.2 Accretion disks ....................................... 296
12.2.1 Flat disks ......................................... 296
12.2.2 Inflated disks .................................... 299
12.3 Reflection nebulae ..................................... 302
12.4 Starburst nuclei ....................................... 304
12.5 Mass loss giants ...................................... 307
12.5.1 Flow equations .................................... 307
12.5.2 Solutions to the flow equations ...................... 310
12.6 The effective extinction curve .......................... 314
12.6.1 The effective optical thickness ....................... 314
12.6.2 Monte Carlo simulations ........................... 316

A Various dust related physics ................................ 319
A.1 Boltzmann statistics .................................. 319
A.1.1 The probability of an arbitrary energy distribution . 319
A.1.2 Partition function and population of energy cells .... 321
A.1.3 The mean energy of harmonic oscillators .............. 323
A.1.4 The Maxwellian velocity distribution ................. 323
A.2 Quantum statistics .................................... 325
A.2.1 The unit cell $\hbar^3$ of phase space ................. 325
A.2.2 Bosons and fermions ................................ 326
A.3 Thermodynamics ....................................... 328
A.3.1 The ergodic hypothesis ................................ 328
A.3.2 Definition of entropy and temperature ............... 330
A.3.3 The canonical distribution .......................... 331
A.3.4 Thermodynamic relations ............................ 332
A.3.5 Equilibrium conditions of the state functions ....... 335
A.4 Blackbody radiation ..................................... 337
A.4.1 The Planck function .................................. 337
A.4.2 Low and high frequency limit ......................... 338
A.4.3 The laws of Wien and Stefan-Boltzmann ............... 339
