CONTENTS

INTRODUCTION

1. SPECIFICATION OF ABSTRACT DATA TYPES WITH PARTIAL OPERATIONS
   1.1. Abstract data types - ADT's
   1.2. Parameterized abstract data types - PADT's
   1.3. The definition of the semantics of a functional language over arbitrary PADT's as a complex example

2. EQUATIONAL PARTIALITY
   2.1. Set-theoretical notions
   2.2. Many-sorted algebras
   2.3. Equationally partial heterogeneous algebras
   2.4. Hierarchy conditions
   2.5. hep-varieties and hep-quasi-varieties

3. PARTIAL ALGEBRAS DEFINED BY GENERATORS AND RELATIONS
   3.1. Derivability of elementary implications
   3.2. Free partial algebras
   3.3. Partial quotient algebras
   3.4. Theorem of homomorphisms
   3.5. Relatively free partial algebras

4. CANONS - INITIALLY RESTRICTING ALGEBRAIC THEORIES
   4.1. Canon model classes
   4.2. Computability and definability on parameterized abstract data types
   4.3. Canon morphisms
