Introduction: On equilibrium selection	1
1. The equilibrium concept	1
2. Examples of games with multiple equilibria	4
3. Refinement concepts versus equilibrium selection theory	13
4. The state of the art in equilibrium selection	19
4.1 NASH's selection approach for unanimity bargaining games	19
4.2 The Harsanyi–Selten theory of equilibrium selection	24
4.2.1 Uniformly perturbed games in standard form	26
4.2.2 The tracing procedure	28
4.2.3 The method of how to solve a game	30
4.2.4 Properties of the Harsanyi–Selten theory	34
4.2.5 The solution procedure	37
5. Equilibrium selection based on resistance avoidance (ESBORA)	43
5.1 The general motivation	43
5.2 The idea of resistance avoidance	46
5.3 The selection procedure	51
5.4 Possible modifications of the ESBORA–concept	53
Part I: The concept of resistance avoidance	59
1. Modelling finite noncooperative games	59
2. The definition of resistance dominance	65
3. General properties of resistance dominance	72
4. Applying the principle of resistance avoidance	80
4.1 Games with complete information	80
4.1.1 A simple 2–person game with three strict equilibrium points	81
4.1.2 A 3–person game with two solution candidates	83
4.1.3 A 3–person game with an unbiased threat	86
4.1.4 An extensive game with chance moves	88

4.2	Games with incomplete information	91
4.2.1	Unanimity bargaining games with incomplete information	91
4.2.2	Wage bargaining with incomplete information	99
4.2.3	An art forgery situation	101
Part II: Generating complete (agent) normal forms and candidate sets		105
1.	Uniformly perturbed (agent) normal forms	106
2.	Cell composition	107
3.	Completing cell games and the residual game	109
4.	Generating irreducible games	110
5.	Generating candidate sets for irreducible games	111
6.	The limit solution for the unperturbed game	114
7.	Simplifications of the solution procedure in nondegenerate games	119
8.	Examples	121
8.1	A degenerate unanimity bargaining game	122
8.2	An extensive game	128
8.3	The Condorcet Paradox	130
8.4	A 2–person bargaining game with a nonbargaining strategy on one side	137
8.4.1	The case of simultaneous decisions	138
8.4.2	Sequential agent splitting	140
8.5	A 2–person bargaining game with a nonbargaining strategy on both sides	146
Part III: Generalizing the weights for normalized individual resistances		148
1.	The 'one seller and $n-1$ buyers'–problem	148
2.	The generalized ESBORA–concept	152
3.	Examples	158
3.1	The 'one seller and $n-1$ buyers'–problem reconsidered	158
3.2	A class of 3–person games with three solution candidates	160

3.3	Decentralized or centralized bargaining?	164
3.4	Market entry games	168
Part IV: Further perspectives for improving the ESBORA-concept		172
1.	Continuous weights	172
1.1	New weights	173
1.2	Alternative weights	175
1.3	A 3-person game in the light of the various weighting approaches	176
1.4	The 'one seller and n-1 buyers'-problem once again	179
1.5	A 3-person bargaining game with an unbiased threat reconsidered	180
2.	Defining restricted games by the formation structure	182
3.	Mixed strategy equilibria as solution candidates	186
3.1	On mixed strategy solutions	187
3.2	Changing the definition of solution candidates	189
Final Remarks		192
Notations		195
