# Contents

0 Background of the problem ................................. 1  
  0.1 Statistical mechanics ................................ 1  
  0.2 Solvable models ...................................... 6  

1 The spin 1/2 XXZ model for $\Delta < -1$ ................ 11  
  1.1 Quantum Hamiltonian .................................. 11  
  1.2 Three regions in $\Delta$ ............................... 13  
  1.3 The anisotropic limit ................................ 14  
  1.4 One point function $\langle \text{vac}|\sigma_1^z|\text{vac}\rangle$ ...... 16  

2 The six-vertex model in the anti-ferroelectric regime ... 19  
  2.1 Vertex model ......................................... 19  
  2.2 Ground states and low-temperature expansion ......... 21  
  2.3 The correlation function .............................. 23  
  2.4 Transfer matrix ...................................... 24  

3 Solvability and Symmetry .................................. 27  
  3.1 Commuting Hamiltonians ............................... 27  
  3.2 Yang-Baxter equation ................................ 28  
  3.3 $Z$-invariant lattice ................................ 29  
  3.4 Quantum affine algebra $U_q(\widehat{sl}_2)$ ............ 34  
  3.5 $R$ matrix as an intertwiner .......................... 37  
  3.6 Dual modules and crossing symmetry .................. 39  
  3.7 Abelian and non-abelian Symmetries .................. 42  

4 Correlation functions—physical derivation ............... 45  
  4.1 Corner Transfer Matrix ................................ 45  
  4.2 Properties of Vertex Operators ....................... 50  
  4.3 The one point function ............................... 57
4.4 Trace functions and difference equations ........................................ 60

5 Level one modules and bosonization .............................................. 63
  5.1 Highest weight modules ........................................................... 63
  5.2 Drinfeld's generators .................................................................. 64
  5.3 Realization of level one modules ................................................. 66
  5.4 Principal vs. homogeneous pictures ........................................... 69

6 Vertex operators .............................................................................. 71
  6.1 The notion of vertex operators ................................................... 71
  6.2 Type I vertex operator .................................................................. 72
  6.3 Type II vertex operator ................................................................ 76
  6.4 Commutation relations ............................................................... 76
  6.5 Dual vertex operators .................................................................. 78
  6.6 Principal picture ......................................................................... 80

7 Space of states—mathematical picture ............................................. 83
  7.1 Space of states ........................................................................... 83
  7.2 Translation and local operators ................................................... 85
  7.3 Transfer matrix .......................................................................... 86
  7.4 Vacuum ....................................................................................... 87
  7.5 Eigenstates .................................................................................. 89

8 Traces of vertex operators ............................................................... 93
  8.1 Calculating the trace .................................................................... 93
  8.2 Result ......................................................................................... 98
  8.3 Examples .................................................................................... 102
  8.4 Orthogonality of the eigenvectors ................................................. 103

9 Correlation functions and form factors .......................................... 109
  9.1 Correlation functions .................................................................. 109
  9.2 Form factors ............................................................................... 111
  9.3 Matrix elements .......................................................................... 113
  9.4 Completeness relation ................................................................ 115

10 The $XXX$ limit $q \to -1$ ................................................................. 119
  10.1 The $XXX$ limit and the continuum limit .................................... 119
  10.2 Scaling ...................................................................................... 120
  10.3 Critical values of the correlators ............................................... 121
  10.4 Form factors in the limit ............................................................ 123
CONTENTS

11 Discussions ................................................................. 127
  11.1 Other models ......................................................... 127
  11.2 The $q$-KZ equation ................................................. 130
  11.3 Related works ....................................................... 132

Appendix A. List of formulas ............................................... 135
  A.1 $R$ matrix ................................................................. 135
  A.2 $U_q(\widehat{sl}_2)$ ....................................................... 136
  A.3 Currents and vertex operators ...................................... 139
  A.4 Properties of Vertex operators .................................... 140
  A.5 Principal vs homogeneous pictures ................................. 142
  A.6 Space of states ......................................................... 143

Bibliography ................................................................. 145
