Preface	v
Contents	ix
Introduction	1
<b>PART A: COMBINATORS AND TRUTH</b>	<b>11</b>
<b>I</b> Introducing operations	<b>13</b>
1.    The basic language	14
2.    Operations I: general facts	15
3.    Operations II: elementary recursion theory	18
4A.   The Church-Rosser theorem	22
4B.   Term models	26
5.    The graph model	28
6.    An effective version of the extensional model $D_\infty$	34
Appendix	39
<b>II</b> Extending operations with reflective truth	<b>43</b>
7.    Extending combinatory algebras with truth	45
8.    The theory of operations and reflective truth: simple consequences	51
9A.   Type-free abstraction, predicates and classes	55
9B.   Operations on predicates and classes	59
10A.  The fixed point theorem for predicates	63
10B.  Applications to semantics and recursion theory	68
11.   Non-extensionality	73
Appendix I: a property theoretic definition of the fixed point operator for predicates	76
Appendix II: on the explicit abstraction theorem	77
Appendix III: independence of truth predicates from the encoding of logical operators	80

<b>PART B: TRUTH AND RECURSION THEORY</b>	<b>83</b>
III Inductive models and definability theory	85
12. Inductive models and the induction theorem	86
13. The envelope of an inductive model	88
14. The uniform ordinal comparison theorem for inductive models	91
15. Applications of the uniform ordinal comparison theorem	97
IV Type-free abstraction with approximation operator	103
16. Approximating properties by classes	104
17. The approximation theorem for extensional operations and the fixed point theorem for monotone operations	109
18. Topology displayed: basic definitions	113
19. The representation theorem for explicitly <i>CL</i> -continuous operators	117
Appendix: alternative proofs	122
V Type-free abstraction, choice and sets	125
20. Choice principles and the distinction between operations and functions	126
21. Admissible hulls: elementary facts	131
22. A model of admissible set theory	137
23. The boundedness theorem	144
<b>PART C: SELECTED TOPICS</b>	<b>149</b>
VI Levels of implication and intensional logical equivalence	151
24. Myhill's levels of implication	152
25. Formal deducibility based on levels of implication and its proof-theoretic strength	158
26. Introducing an intensional equivalence relation	162
27. The infinitary reduction relation $\Rightarrow$	165
28. The Church-Rosser theorem for $\Rightarrow$	169
29. A model of type-free logic based on intensional equivalence	174
VII On the global structure of models for reflective truth	177
30. The lattice of fixed point models for the neutral minimal theory	179
31. The sublattice of intrinsic fixed point models and the cardinality theorem	186

32.	Variations on the encoding technique: non-modularity and other oddities	192
33.	A model for an impredicative extension of reflective truth	198
34.	On Kripke's classification of self-referential sentences	203
35.	On the consistency of coinduction principles Appendix: a variant to the basic operator $\Gamma$ and the restriction axiom	207 209
PART D: LEVELS OF TRUTH AND PROOF THEORY		213
VIII	Levels of reflective truth	215
36.	A language and axioms for reflective truth with levels	218
37.	Simple consequences	220
38.	Universes and the Weyl extended iteration principle	225
39.	A recursion-theoretic model	230
40.	Levels of truth and predicatively reducible subsystems of second-order arithmetic	238
41.	Consistency of a reducibility principle for classes	244
42.	Levels of truth and impredicative subsystems of second-order arithmetic Appendix: on projectibility and stronger reflection	248 253
IX	Levels of truth and predicative well-orderings	257
43.	On well-orderings	258
44.	Ramified hierarchies	261
45.	Predicative well-orderings I	269
46.	Predicative well-orderings II	277
X	Reducing reflective truth with levels to finitely iterated reflective truth	285
47.	A sequent calculus STLR for a theory of reflective truth with levels	286
48.	Basic properties of STLR	291
49A.	Elimination of the full level induction schema	293
49B.	Elimination of unbounded level quantifiers	297
50.	The infinitary sequent calculus $IT_n^\infty$ of $n$ -iterated reflective truth	303
51.	Embedding $STLR_n$ into $IT_n^\infty$	305
XI	Proof-theoretic investigation of finitely iterated reflective truth	311
52.	The ramified system $RS_n$	312
53.	Cut elimination	316
54.	Some derivable sequents of $RS_n$	320

55.	Embedding $IT_n^\infty$ into $RS_n$	324
56.	The upper bound theorem for $IT_n^\infty$	327
57.	Upper bound theorems for TLR and its subsystems	329
58.	Conclusion: the conservation theorems	335
	Appendix: primitive recursive cut elimination for $RS_n$	338
PART E: ALTERNATIVE VIEWS		349
XII	Non-reductive systems for type-free abstraction and truth	351
59.	The core system $VF^-$ and transfinite induction	352
60.	Supervaluation models of $VF^-$	357
61.	An abstract sequent calculus and truth	358
62.	Cut elimination and related properties	364
63.	A provability interpretation and the upper bound theorem	369
64.	Reconciling supervaluation models with provability interpretation	375
XIII	The variety of non-reductive approaches	379
65.	An inconsistency	380
66.	On a truth theory of Friedman and Sheard	383
67.	Fitch's models	386
68.	Introducing semi-inductive definitions	390
69.	Semi-inductive models for reflective truth	394
XIV	Epilogue: applications and perspectives	401
70A.	A logical theory of constructions: informal motivations	402
70B.	A logical theory of constructions: basic syntax	403
71.	Axioms for the computation relations	407
72.	Extending the logical theory of constructions with higher reflection	411
73.	Proof-theoretic reduction	416
74.	Perspectives: related work in Artificial Intelligence and Theoretical Linguistics	419
75.	Sense and denotation as algorithm and value: subsuming theories of reflective truth under abstract recursion theory	422
	Bibliography	425
	Index	441
	List of Symbols	453
