Preface xix

About the Authors xxi

Study Aids xxii

section I microbial activity 1

chapter 1 *Microbial Activity: An Introduction* 1

- Introduction 3**
- What is a microbe? 3**
- Having a long past 5**
- Being small 6**
- Being many 8**
- Growing and persisting 8**
- Colonizing every niche and making Earth inhabitable 9**
- Shaping the planet 11**
- Making a living 12**
- Cooperating for complex endeavors 13**
- Conclusions 15**
- Study questions 15**

section II structure and function 17

chapter 2 *The Microbial Cell: Structure and Function* 17

- Introduction 17**
- Prokaryotic cells 19**
- Microscopes 20**
 - Newer microscopes 21
 - Scanned-proximity probe microscopes 21

Molecular stains 21

Prokaryotes have complex envelopes and appendages 22

The cell membrane 22

How the cell membrane is protected 23

The gram-positive solution 23

The gram-negative solution 26

The acid-fast solution 28

Crystalline surface layers 29

Bacteria without cell walls: the mycoplasmas 30

Cell envelopes of the Archaea 30

Capsules, flagella, and pili: how prokaryotes cope in certain environments 31

Capsules and slime layers 31

Flagella 32

Pili 35

Study questions 37

chapter 3 prokaryotic cell structure and function: the cell interior 38

General observations 39

The nucleoid 39

The cytoplasm 44

Inclusions and vesicles 45

Gas vesicles 45

Organelles for photosynthesis and chemosynthesis 46

Carboxysomes 46

Enterosomes 47

Storage granules and others 47

Conclusions 47

Study questions 48

section III growth 49

chapter 4 growth of microbial populations 50

Introduction 51

How to measure growth of a bacterial culture 53

When should the growth rate be determined? 54

The law of growth 55

Balanced growth 57

Continuous culture 58

How is the physiology of the cells affected by the growth rate? 59

Effects of temperature, hydrostatic pressure, osmotic strength, and pH 61

Temperature 62

Effect on growth rate 62

Classifying the temperature responses of microbes 63

Growth limits at temperature extremes 63

Lethal effects 66

Hydrostatic pressure 67
Osmotic pressure 67
pH 68

Conclusions 68

Study questions 69

chapter 5 *growth metabolism* 71

Introduction 71

Growth metabolism: making life from nonlife 71

Framework of growth metabolism 73

Making two from one 74
Assembling cell structures 75
Making macromolecules 76
Synthesizing building blocks 76
Fueling 77

Global effects of growth metabolism 80

Earth's chemical cycles 80
Bioremediation 80

Summary and plan 81

Study questions 81

chapter 6 *fueling* 82

Overview of fueling reactions 83

Getting energy and reducing power 84

Driving force and its generation 84
Substrate level phosphorylation and fermentation 87
Transmembrane ion gradients 90
Respiration 90
Photosynthesis 94
Enzyme pumps 96
Scalar reactions 96
Oxygen and life 98

Making precursor metabolites: heterotrophy 98

Acquiring nutrients 98
Transport through the OM of gram-negative bacteria 99
Transport through the cell membrane 100
Feeder pathways 103
Central metabolism 104
Common pathways of central metabolism 104
Auxiliary pathways of central metabolism 106
Diversity and flexibility of central metabolism 107

Making precursor metabolites: autotrophy 109

The Calvin cycle 109
Other CO₂-fixing cycles 109

Summary 110

Study questions 111

chapter 7 *biosynthesis* 112

Some general observations 113

Biosynthesis and nutrition 113
Bacterial studies and biosynthetic pathways 113
The concept of a biosynthetic pathway 114

Assimilation of nitrogen 118

Central actors: glutamate and glutamine 118

Synthesis of glutamate and glutamine 120

Getting ammonia 121

Ammonia from dinitrogen 122

Assimilation of sulfur 122

Assimilation of phosphorus 124

Pathways to building blocks 124

Amino acids 124

Nucleotides 125

Sugars and sugar-like derivatives 126

Fatty acids and lipids 126

Summary 127

Study questions 127

chapter 8

Introduction 131

DNA 132

Overview of replication 132

Initiation of replication 133

DNA strand elongation 135

Repair of errors in replication 136

Termination of replication 138

Protecting the DNA 139

Assembly of the nucleoid 140

RNA 141

Overview of transcription 141

RNA-P and its function 141

Products of transcription 142

Initiation of transcription 142

The promoter 143

Starting the transcript 145

RNA chain elongation 145

Termination of transcription 146

Fate of transcripts 146

Life and death of mRNA 147

Modification and assembly of stable RNA 147

Polymerase collision and genome organization 148

Protein 149

Special tempo and mode of protein synthesis 149

Translation 151

Initiation of protein synthesis 151

Polypeptide chain elongation 153

Termination of translation 155

Processing of proteins 156

Covalent modification 156

Protein folding 157

Translocation of proteins 158

Envelope formation 162

Challenges of envelope formation 162

The cell membrane 163

The cell wall 164

The outer membrane 165

Appendages 165

Capsules 166

Concluding remarks 166

Study questions 166

chapter 9 the cell division cycle 168

Introduction 169

Strategies for studying the bacterial cell cycle 169

DNA replication during the cell cycle 171

How is DNA replication regulated? 172

Cell division 174

Morphological considerations 174

How is the septum formed? 175

How does a bacterium find its middle? 177

The connection between cell division and DNA replication 178

Cell division and plasmid replication 180

The prokaryotic equivalent of mitosis 181

Study questions 182

section IV inheritance 183

chapter 10 genetics 184

Introduction 185

Exchange of DNA among prokaryotes 185

Transformation 186

Artificial transformation 187

Natural transformation 187

Transduction 189

Generalized transduction 190

Abortive transduction 191

Specialized transduction 192

Conjugation 193

Conjugation among gram-negative bacteria 193

Conjugation among gram-positive bacteria 195

Mutation and sources of genetic variation among prokaryotes 195

Kinds of mutations 196

Sources of mutations 197

Mutagens 198

Site-directed mutagenesis 200

Genomics 200

Annotation 201

Relatedness 202

Conclusions 202

Study questions 203

chapter 11 evolution 204

Overview 205

Sequence of bases in macromolecules 206

Small-subunit ribosomal RNA 206
Proteins as markers of evolution 208

The universal ancestor 210

Origin of life 211

Mechanisms of bacterial evolution 212

Darwinism 212

Neo-Lamarckism 213

Early eukaryotes and endosymbiosis 214

Evolution of molecules 216

Conclusions 217

Study questions 217

section v physiology 219

chapter 12

Introduction 221

Evidence for coordination of metabolic reactions 221

Coordination in biosynthesis 221

Coordination in fueling 222

Coordination in polymerization 223

Two modes of regulation 223

Controlling enzyme activity 224

Controlling enzyme amounts 224

Why two modes of regulation? 224

Modulation of protein activity 225

Allosteric interactions 225

Allostery in biosynthesis 226

Allostery in fueling 227

Covalent modification 228

Modulation of protein amounts 228

Regulation of operon expression 229

Mechanisms at site 1: promoter recognition 232

Mechanisms at sites 2, 3, and 4: transcriptional repression, activation, and enhancement 232

Mechanisms at site 5: targeting by sRNAs 233

Mechanisms at site 6: DNA supercoiling 233

Mechanisms at site 7: translational repression 234

Mechanisms at site 8: attenuation 234

Mechanisms at site 9: mRNA stability 238

Mechanisms at site 10: proteolysis 238

Regulation beyond the operon 238

Regulatory units above the operon 239

Examples of global regulatory systems 242

Cooperative interaction of regulatory devices 245

Summary and conclusions: networks for coordination and response 245

Study questions 246

chapter 13 succeeding in the environment 248

Microbes in their habitat 249

Coping with stress as individual cells 250

Nature of stress 250

- Overview of stress responses 251
 - Sensing the environment 251
 - Complex circuitry for complex responses 252
 - Monitoring stimulons 253
- Major stress response networks 257
 - Global response networks 257
 - The ultimate stress response: stationary phase 259
- Stress responses and microbial diversity 262
- Stress responses and safety in numbers 263
- Coping with stress by escaping 263
 - Flagellar motility 264
 - Swarming motility 267
 - Gliding motility 267
 - Twitching motility 268
- Coping with stress by community effort 268**
 - Sensing the population 268
 - Formation of organized communities 270
 - Quorum sensing, motility, and biofilm formation 271
- Conclusions 271**
- Study questions 272**

chapter 14 differentiation and development 274

- Overview 275**
- Endospores 277**
 - Properties 277
 - Phylogenetic distribution 277
 - Formation 278
 - Programming and regulation 280
 - Activation of Spo0A 280
 - Activity of Spo0A-P 281
 - Sporulation: a group activity 281
- Development of *Caulobacter crescentus* 282**
 - The cell cycle 282
 - Genetic control of development 283
- Development of myxobacteria 284**
 - Regulation of development 285
- Other bacteria that undergo differentiation and development 286**
- Summary 287**
- Study questions 287**

section VI prokaryotic diversity

chapter 15 prokaryotic diversity 291

- Introduction 291**
- Making order of prokaryotic diversity 291**
- Prokaryotic species 293**
- Extent of prokaryotic diversity 294**
- Higher taxa of prokaryotes 297**
- Archaea 297**
 - Crenarchaeota 299

Euryarchaeota 299
Methanogens 300
Extreme halophiles 301

Bacteria 302

Phylum B4: Deinococcus-Thermus 303
Phylum B10: Cyanobacteria 306
Phylum B12: Proteobacteria 307
Alphaproteobacteria 307
Betaproteobacteria and Gammaproteobacteria 309
Phylum B14: Actinobacteria 309

Conclusions 310

Study questions 310

chapter 16

Introduction 313

Fungi 314

The yeasts 315
The fungal lifestyle 316
Why is yeast such a popular genetic tool? 318

Protists 319

Paramecium 319
Plasmodium, the parasite that causes malaria 322
Diatoms and others 325

Conclusions 328

Study questions 328

chapter 17

Introduction 331

Size and shape 331

Ecology and classification 334

Viral replication 335

Attachment and penetration 335
Viral nucleic acid synthesis: a theme with variations 337
Making viral proteins 338
Virion assembly and release from the host cell 340
Visualizing and quantitating viral growth 341

Lysogeny and integration into the host genome 341

Introduction 341
How does the genome of a temperate phage become integrated into that of a host cell? 343
How does the integrated viral genome remain quiescent? 344
What causes viral induction? 345
Deciding between lysogeny and lysis 345
What are the genetic consequences of lysogeny? 346
What is the effect of lysogeny in evolution? 347

Viroids and prions 347

Viroids 348
Prions 349

Conclusions 350

Study questions 351

section VII interactions 353

chapter 18 *Microbial Ecology*

Overview 355

Methods of microbial ecology 357

Enrichment culture 358

Studying microbes in the laboratory and in their natural environments 358

Biogeochemical cycles 361

Carbon and oxygen cycles 361

The nitrogen cycle 364

The sulfur cycle 367

The phosphorus cycle 368

Solid substrates 369

Microbial ecosystems 370

Soil 370

Oceans 370

Microbes, climates, and weather 372

The future of microbial ecology 373

Conclusions 374

Study questions 374

chapter 19 *Complex Interactions and Antagonism*

Symbiosis 377

Introduction 377

Mitochondria, chloroplasts, and the origin of eukaryotic cells 378

Bacterial endosymbionts of insects: organelles in the making? 381

Nitrogen-fixing bacteria and the legumes 385

The rumen and its microbes 388

Feeding via a murderous partnership: bacteria and nematodes 390

Leaf-cutting ants, fungi, and bacteria 391

Behavioral changes due to parasitism 393

Reckless rats and fatal attraction 393

The urge to climb 394

When is a flower not a flower? 394

Predation 395

Antibiotics and bacteriocins 398

Conclusions 399

Study questions 400

chapter 20 *Microbial Interactions with Plants*

Introduction 403

Encounter 404

Entry 405

Becoming established 405

Causing damage 406

Host defenses 407

Innate defenses 408

External barriers 408

In tissues 408

How do microbes evade the innate defenses? 414

Intracellular life 416

Adaptive defenses 416

Antibodies 416

Cell-mediated immunity 418

Immunological memory 420

How do microbes defend themselves against adaptive immunity? 421

Integration of the defense mechanisms 422

Conclusions 422

Study questions 422

chapter 21

Introduction 425

Case reports 426

Tetanus, a relatively "simple" infectious disease 426

An outbreak of hemorrhagic colitis, a complicated infection caused by *E. coli* strain O157:H7 428

TB, a disease caused mainly by the host response 432

Infectious mononucleosis: the "kissing disease" 435

How does EBV cause infectious mono? 437

How does EBV persist in the body? 437

How does EBV contribute to cancer? 438

HIV infection and AIDS 438

Conclusions 442

Study questions 442

chapter 22

Introduction 445

How infectious diseases change 447

Microbial agents of warfare 449

Smallpox 449

Anthrax 450

Anthrax as a weapon 452

A microbiological ruse 452

Coping with danger in a microbial world 453

Sanitation 453

Vaccination 453

Antimicrobial drugs 454

Conclusion 454

Suggested reading 455

Study questions 455

chapter 23

putting microbes to work 456

Introduction 457

Various uses of microbes 457

Making better wines: the malolactic fermentation 458

Protecting plants and making snow: ice-minus bacteria 460

Using microbes to make protein drugs: insulin and human growth hormone (hGH) 462

Microbial enzymes: sweeteners from corn 464

Biological insecticides: *Bt* 467

Undoing pollution: bioremediation 468

Conclusion 471

Study questions 471

Coda 473

Glossar 475

Answers to Study Questions 495
