CONTENTS

Foreword ................................................. ix
Foreword to the French Edition ......................... xi
Preface to the French Edition ............................. xiii

Part I. Methods and Models

Chapter I. Graphs
1. Introduction ........................................... 3
2. The Use of Points and Arcs to Represent Structures ... 3
3. Principal Concepts Used in the Theory of Graphs .... 8
4. Scheduling and Sequencing Problems ................... 11
5. Tree of a Graph ........................................ 29
7. Application of the Theory of Graphs to Psychosociology ........... 52

Chapter II. Dynamic Programming
9. Introduction ............................................ 76
10. Bellman's Theorem of Optimality ....................... 77
11. First Example of Multistage Optimization ............. 79
12. Distribution of Investments ............................... 86
13. A Purchasing Problem ................................. 92
14. Decisions in the Face of Uncertainty .................. 102
15. Two Examples of Dynamic Programming in the Face of an Uncertain Future 107
16. Theorem of Optimality in the Case of Uncertainty. Discrete Systems ... 129
17. Interval of Anticipation. Dynamic Programming with Adaptation .... 136
18. Effect of Introducing a Rate of Interest ............... 146

Chapter III. The Theory of Games of Strategy
19. Introduction ........................................... 150
20. Game on a Rectangular Matrix .......................... 151
21. Point of Equilibrium of a Rectangular Game ........... 153
22. Pure Strategy and Mixed Strategy ...................... 156
23. Various Properties ...................................... 162
Chapter VI. **Mathematical Properties of Games of Strategy**

65. Introduction .......................................................... 406
66. Various Properties Connected with the Maximal and Minimal Values of Functions ........................................... 406
67. Fundamental Theorem for Games of Strategy ...................... 411
68. Various Proofs .......................................................... 413
69. Calculating the Numerical Solution of a Rectangular Game .... 426
70. Reducing a Rectangular Game to a Linear Program ............... 441
71. Reducing a Linear Program to a Rectangular Game ............... 445
72. Evaluation by Multistage Adaptation ................................ 452
73. Finding Bayes's Optimal Strategy in a "Game against Nature" .. 455
74. Game with a Continuous Function ................................... 461
75. Games with \( n \) Players and a Zero Sum \((n > 2)\) ............... 465
76. Games with \( n \) Players \((n \geq 2)\) with a Nonzero Sum .......... 470

Conclusion ................................................................. 471

**Bibliography**

IX. Theory of Graphs and Their Applications .......................... 473
X. Dynamic Programming .................................................. 476
XI. Theory of Games of Strategy ......................................... 477

**Subject Index** .......................................................... 481
