C. H. Edwards, Jr.

The Historical Development of the Calculus

With 150 Illustrations

Springer-Verlag
New York Berlin Heidelberg London Paris
Tokyo Hong Kong Barcelona Budapest

Contents

1	**Area, Number, and Limit Concepts in Antiquity**	**1**
	Babylonian and Egyptian Geometry	1
	Early Greek Geometry	5
	Incommensurable Magnitudes and Geometric Algebra	10
	Eudoxus and Geometric Proportions	12
	Area and the Method of Exhaustion	16
	Volumes of Cones and Pyramids	19
	Volumes of Spheres	24
	References	28
2	**Archimedes**	**29**
	Introduction	29
	The Measurement of a Circle	31
	The Quadrature of the Parabola	35
	The Area of an Ellipse	40
	The Volume and Surface Area of a Sphere	42
	The Method of Compression	54
	The Archimedean Spiral	54
	Solids of Revolution	62
	The Method of Discovery	68
	Archimedes and Calculus?	74
	References	75
3	**Twilight, Darkness, and Dawn**	**77**
	Introduction	77
	The Decline of Greek Mathematics	78
	Mathematics in the Dark Ages	80

The Arab Connection 81
Medieval Speculations on Motion and Variability 86
Medieval Infinite Series Summations 91
The Analytic Art of Viète 93
The Analytic Geometry of Descartes and Fermat 95
References 97

4 Early Indivisibles and Infinitesimal Techniques 98

Introduction 98
Johann Kepler (1571–1630) 99
Cavalieri's Indivisibles 104
Arithmetical Quadratures 109
The Integration of Fractional Powers 113
The First Rectification of a Curve 118
Summary 120
References 121

5 Early Tangent Constructions 122

Introduction 122
Fermat's Pseudo-equality Methods 122
Descartes' Circle Method 125
The Rules of Hudde and Sluse 127
Infinitesimal Tangent Methods 132
Composition of Instantaneous Motions 134
The Relationship Between Quadratures and Tangents 138
References 141

6 Napier's Wonderful Logarithms 142

John Napier (1550–1617) 142
The Original Motivation 143
Napier's Curious Definition 148
Arithmetic and Geometric Progressions 151
The Introduction of Common Logarithms 153
Logarithms and Hyperbolic Areas 154
Newton's Logarithmic Computations 158
Mercator's Series for the Logarithm 161
References 164

7 The Arithmetic of the Infinite 166

Introduction 166
Wallis' Interpolation Scheme and Infinite Product 170

Quadrature of the Cissoid 176
The Discovery of the Binomial Series 178
References 187

8 The Calculus According to Newton 189

The Discovery of the Calculus 189
Isaac Newton (1642–1727) 190
The Introduction of Fluxions 191
The Fundamental Theorem of Calculus 194
The Chain Rule and Integration by Substitution 196
Applications of Infinite Series 200
Newton's Method 201
The Reversion of Series 204
Discovery of the Sine and Cosine Series 205
Methods of Series and Fluxions 209
Applications of Integration by Substitution 210
Newton's Integral Tables 212
Arclength Computations 217
The Newton–Leibniz Correspondence 222
The Calculus and the *Principia Mathematica* 224
Newton's Final Work on the Calculus 226
References 230

9 The Calculus According to Leibniz 231

Gottfried Wilhelm Leibniz (1646–1716) 231
The Beginning—Sums and Differences 234
The Characteristic Triangle 239
Transmutation and the Arithmetical Quadrature of the Circle 245
The Invention of the Analytical Calculus 252
The First Publication of the Calculus 258
Higher-Order Differentials 260
The Meaning of Leibniz' Infinitesimals 264
Leibniz and Newton 265
References 267

10 The Age of Euler 268

Leonhard Euler (1707–1783) 268
The Concept of a Function 270
Euler's Exponential and Logarithmic Functions 272
Euler's Trigonometric Functions and Expansions 275
Differentials of Elementary Functions *à la* Euler 277

Interpolation and Numerical Integration 281
Taylor's Series 287
Fundamental Concepts in the Eighteenth Century 292
References 299

11 The Calculus According to Cauchy, Riemann, and Weierstrass 301

Functions and Continuity at the Turn of the Century 301
Fourier and Discontinuity 304
Bolzano, Cauchy, and Continuity 308
Cauchy's Differential Calculus 312
The Cauchy Integral 317
The Riemann Integral and Its Reformulations 322
The Arithmetization of Analysis 329
References 333

12 Postscript: The Twentieth Century 335

The Lebesgue Integral and the Fundamental Theorem of Calculus 335
Non-standard Analysis—The Vindication of Euler? 341
References 346

Index 347
