Preface to the Third Edition .......................... v
Preface to the Second Edition ..................... vii
Preface to the First Edition ........................ ix

Introduction ........................................... 1

I  Some Facts on Sound Waves, Sources and Hearing ........................................ 7
I.1 Acoustical quantities ................................ 7
I.2 Plane waves, energy density and sound intensity .......... 9
I.3 Spherical waves, sound radiation ..................... 11
I.4 Non-harmonic sound signals .......................... 14
I.5 Sound pressure level and sound power level ............... 18
I.6 Some properties of human hearing ....................... 19
I.7 Properties of natural sound sources ...................... 22

II  The Sound Field in Front of a Wall ................. 28
II.1 Reflection factor, absorption coefficient and wall impedance 29
II.2 Sound reflection at normal incidence ................. 30
II.3 Sound reflection at oblique incidence ................. 33
II.4 A few examples ..................................... 36
II.5 Random sound incidence ................................ 44

III  The Sound Field in a Closed Space (Wave Theory) .... 50
III.1 Formal solution of the wave equation for an enclosure 51
III.2 Normal modes of vibration in rectangular rooms with rigid boundaries ........... 54
III.3 Non-rigid walls ..................................... 62
III.4 Steady state sound field ............................. 66
III.5 Decaying modes in rooms, reverberation ............... 74
### Contents

#### IV The Limiting Case of Very High Sound Frequencies:

- **Geometrical Room Acoustics**
  - IV.1 The reflection of sound rays .................................................. 81
  - IV.2 Sound reflections in a room .................................................. 82
  - IV.3 The temporal distribution of reflections .................................. 85
  - IV.4 The directional distribution of reflections, diffusion ............. 91

#### V Reverberation and Steady State Energy Density in Diffuse Sound Fields

- V.1 Basic properties and realisation of diffuse sound fields ............ 100
- V.2 Mean free path and average number of reflections per second .... 101
- V.3 Sound decay and reverberation time ........................................ 110
- V.4 The influence of unequal path lengths ..................................... 114
- V.5 Steady state energy density in a reverberant space with diffuse sound field .................................................. 118
- V.6 Partially diffuse sound field .................................................. 120
- V.7 Coupled rooms ........................................................................... 123

#### VI Sound Absorption and Sound Absorbers

- VI.1 The attenuation of sound in air ............................................... 133
- VI.2 Unavoidable wall absorption .................................................... 134
- VI.3 Sound absorption by vibrating or perforated walls .................... 137
- VI.4 Extended resonance absorbers ................................................ 138
- VI.5 Single resonators ..................................................................... 141
- VI.6 Sound absorption by porous materials ...................................... 146
- VI.7 Audience and seat absorption .................................................. 150
- VI.8 Anechoic rooms ........................................................................ 154

#### VII The Subjective Effects of Combined Sound Fields

- VII.1 Some general remarks on reflections and echoes ....................... 171
- VII.2 The perceptibility of single reflections .................................... 174
- VII.3 Echoes and colouration ........................................................... 176
- VII.4 Early energy and its relation to speech intelligibility and to clarity . 180
- VII.5 Early lateral energy and its relation to 'spaciousness' ............... 189
- VII.6 The subjective effect of reverberation: optimum reverberation times and early decay time .................................................. 196
- VII.7 Steady state sound pressure level and acoustical quality ......... 201
- VII.8 Assessment of concert hall acoustics ...................................... 204

#### VIII Measuring Techniques in Room Acoustics

- VIII.1 General remarks on instrumentation and procedures for acoustical measurements .................................................. 218
- VIII.2 Measurement of the impulse response ..................................... 219
- VIII.3 Correlation measurements ..................................................... 221
- VIII.4 Examination of the time structure of the impulse response ....... 227
