CONTENTS

Preface ................................................................. v

1 Separation of Variables .............................................. 2
  1.1 The Schrödinger equation .................................. 2
  1.2 Separation of the time-independent wave equation.
      Translational motion ................................ 4
  1.3 Separation of the central-field equation ................. 6

2 Nuclear Motion Separability in Diatomic Molecules ......... 9
  2.1 Experiment versus theory for the hydrogen molecule .... 9
  2.2 Separation of the centre-of-mass motion ................. 10
  2.3 Adiabatic approximation .................................. 12
  2.4 Separation of rotations and vibrations .................. 16
  2.5 Calculations for the H₂ molecule ......................... 17
  2.6 Non-adiabatic effects ..................................... 20
  2.7 Potential energy curves ................................... 21
  2.8 Generator coordinate theory of molecular spectra ....... 24

3 Vibronic Coupling in Polyatomic Molecules .................. 29
  3.1 The Schrödinger equation ................................ 29
  3.2 Adiabatic approximation .................................. 32
  3.3 Corrections within adiabatic approximations ............ 35
  3.4 Breakdown of adiabatic approximations .................. 39
  3.5 Transition moments ....................................... 44

4 Transition Intensity .............................................. 47
  4.1 Transition momentum versus transition length in com-
      putation of Herzberg–Teller induced intensity .......... 47
  4.2 Born–Oppenheimer approximation and calculation of
      vibrational transition intensities ..................... 50
## CONTENTS

5 Electronically Degenerate States  
5.1 Resonance limit: Jahn–Teller and Renner–Teller effects  .... 53  
5.2 Pseudo Jahn–Teller effect  . 76

6 Vibronic Coupling Calculations  
6.1 Approaches to calculations  . 88  
6.2 *A priori* CNDO calculations  . 93  
6.3 Quadratic and higher order coupling  . 95  
6.4 Two-photon absorption  . 97  
6.5 Breakdown of Born–Oppenheimer approximation  . 101

7 Anharmonicity  
7.1 Occurrence and relevance  . 106  
7.2 Anharmonicity and adiabatic wavefunctions  . 110  
7.3 Local modes  . 115  
7.4 Anharmonicity through nuclear kinetic energy operator  . 118

8 Implications and Manifestations in Molecular Spectroscopy  
8.1 Absorption–emission mirror symmetry: transition moment interferences  . 120  
8.2 Raman scattering  . 138  
8.3 Circular dichroism (CD)  . 145  
8.4 Multiphoton absorption  . 149

9 Molecular Dynamics  
9.1 Radiationless transitions in isolated molecules  . 154  
9.2 Intermolecular energy transfer  . 172  
9.3 Unimolecular reactions  . 177

10 The Solid State  
10.1 Nuclear motions  . 183  
10.2 Frenkel exciton theory  . 184  
10.3 Molecular vibrations  . 186  
10.4 Exciton-phonon interactions  . 196

References  . 205  
Further Reading  . 208  
Appendices  . 210  
Index  . 217
