Contents

Colour plates appear between pages 40 and 41.

1. Introduction 1

2. Surface chemical composition 11
   The extension of bulk techniques to surface studies 11
   Specifically surface techniques 14
   Photoelectron spectroscopy 18
   Auger electron spectroscopy (AES) 25
   Scanning Auger microscopy (SAM) 32
   Quantitative analysis by AES and XPS 35
   Secondary ion mass spectroscopy (SIMS) 37
   Quantitative analysis by SIMS 39
   SIMS, Auger, and XPS microscopies compared 41
   Depth profiling 43
   The atom probe 43
   A case study—NiCrAl+O 45

3. Surface structure 49
   Bulk techniques for structure analysis 49
   Surface methods using electrons 52
   Low-energy electron microscopy (LEEM) 81
   Grazing incidence X-ray diffraction 83
   Field-ion microscopy (FIM) 85
   Scanning tunnelling microscopy (STM) 90
   Ion scattering 95
   Angularly resolved photoelectron spectroscopy 96
   Surface extended X-ray absorption fine structure (SEXAFS) 97
   Predicting the surface crystallography 99
   Some selected surface structures 102
   Absorbates 105
   Summary: surface structure and composition 106

4. Surface properties: electronic 108
   Some theoretical considerations 108
   Contact potential and work function 113
Contents

The measurement of work functions 114
Surface states and band bending 120
Plasmons 127
Single atom spectroscopy and the STM 130
Surface optics 131
Electron spin resonance 133
Case study: the long search—Si(111) 7 × 7 134
Summary 138

5. Surface properties: atomic motion 139
   Surface lattice dynamics 139
   Surface diffusion 147
   Surface melting 150
   Summary 153

6. Surface properties: adsorption of atoms and molecules 154
   Some thermodynamics 155
   Adsorption processes 156
   Theory of chemisorption 161
   Experimental observations of chemisorption 162
   Surface segregation 170
   Epitaxial processes 174
   Molecular beam epitaxy (MBE) 180
   Summary 181
