Marc Yor

Some Aspects of Brownian Motion

Part I:
Some Special Functionals

1992

Birkhäuser Verlag
Basel • Boston • Berlin
# Table of Contents

1 The Gaussian space of Brownian motion .............................................. 1

1.1 A realization of Brownian bridges ................................................. 1
1.2 The filtration of Brownian bridges ............................................... 2
1.3 An ergodic property ........................................................................ 5
1.4 A relationship with space-time harmonic functions .......................... 6
1.5 Brownian motion and Hardy's $L^2$ inequality ................................. 9
1.6 Fourier transform and Brownian motion ....................................... 12

Comments on Chapter 1 ...................................................................... 13

2 The laws of some quadratic functionals of Brownian motion ............. 15

2.1 Lévy's area formula and some variants ........................................... 16
2.2 Some identities in law and an explanation
    of them via Fubini's theorem ....................................................... 21
2.3 The laws of squares of Bessel processes ....................................... 23

Comments on Chapter 2 .................................................................... 26

3 Squares of Bessel processes and Ray-Knight theorems
   for Brownian local times ............................................................... 27

3.1 The basic Ray-Knight theorems ..................................................... 28
3.2 The Lévy-Khintchine representation of $Q_2^X$ ............................... 29
3.3 An extension of the Ray-Knight theorems ..................................... 32
3.4 The law of Brownian local times taken at an
    independent exponential time ...................................................... 34
3.5 Squares of Bessel processes and squares of Bessel bridges ........... 36
3.6 Generalized meanders and squares of Bessel processes ................. 41
3.7 Generalized meanders and Bessel bridges ................................... 45

Comments on Chapter 3 ................................................................... 48
8 Some extensions of Paul Lévy’s arc sine law
for Brownian motion .................................................. 99
8.1 Some notation ..................................................... 100
8.2 A list of results .................................................... 101
8.3 A discussion of methods — Some proofs ....................... 104
8.4 An excursion theory approach to F. Petit’s results ............. 107
8.5 A stochastic calculus approach to F. Petit’s results .......... 115
Comments on Chapter 8 .............................................. 117

9 Further results about reflecting Brownian motion
perturbed by its local time at 0 ...................................... 118
9.1 A Ray-Knight theorem for the local times of $X$, up to $\tau^\mu_s$,
and some consequences ............................................. 118
9.2 Proof of the Ray-Knight theorem for the local times of $X$ ....... 120
9.3 Generalisation of a computation of F. Knight .................... 124
9.4 Towards a pathwise decomposition of $(X_u, u \leq \tau^\mu_s)$ .......... 128
  Comments on Chapter 9 ............................................ 129

Bibliography ........................................................... 131
