FOREWORD xix

PREFACE xxii

PART I GENERAL BACKGROUND

1 GENERAL CHARACTERISTICS OF MODERN POWER SYSTEMS 3

1.1 Evolution of electric power systems 3
1.2 Structure of the power system 5
1.3 Power system control 8
1.4 Design and operating criteria for stability 13
References 16

2 INTRODUCTION TO THE POWER SYSTEM STABILITY PROBLEM 17

2.1 Basic concepts and definitions 17
2.1.1 Rotor angle stability 18
2.1.2 Voltage stability and voltage collapse 27
2.1.3 Mid-term and long-term stability 33
2.2 Classification of stability 34
2.3 Historical review of stability problems 37
References 40
PART II EQUIPMENT CHARACTERISTICS AND MODELLING

3 SYNCHRONOUS MACHINE THEORY AND MODELLING

3.1 Physical description
3.1.1 Armature and field structure
3.1.2 Machines with multiple pole pairs
3.1.3 MMF waveforms
3.1.4 Direct and quadrature axes

3.2 Mathematical description of a synchronous machine
3.2.1 Review of magnetic circuit equations
3.2.2 Basic equations of a synchronous machine

3.3 The $dq0$ transformation

3.4 Per unit representation
3.4.1 Per unit system for the stator quantities
3.4.2 Per unit stator voltage equations
3.4.3 Per unit rotor voltage equations
3.4.4 Stator flux linkage equations
3.4.5 Rotor flux linkage equations
3.4.6 Per unit system for the rotor
3.4.7 Per unit power and torque
3.4.8 Alternative per unit systems and transformations
3.4.9 Summary of per unit equations

3.5 Equivalent circuits for direct and quadrature axes

3.6 Steady-state analysis
3.6.1 Voltage, current, and flux linkage relationships
3.6.2 Phasor representation
3.6.3 Rotor angle
3.6.4 Steady-state equivalent circuit
3.6.5 Procedure for computing steady-state values

3.7 Electrical transient performance characteristics
3.7.1 Short-circuit current in a simple $RL$ circuit
3.7.2 Three-phase short-circuit at the terminals of a synchronous machine
3.7.3 Elimination of dc offset in short-circuit current

3.8 Magnetic saturation
3.8.1 Open-circuit and short-circuit characteristics
3.8.2 Representation of saturation in stability studies
3.8.3 Improved modelling of saturation

3.9 Equations of motion
Contents

3.9.1 Review of mechanics of motion 128
3.9.2 Swing equation 128
3.9.3 Mechanical starting time 132
3.9.4 Calculation of inertia constant 132
3.9.5 Representation in system studies 135

References 136

4 SYNCHRONOUS MACHINE PARAMETERS 139

4.1 Operational parameters 139
4.2 Standard parameters 144
4.3 Frequency-response characteristics 159
4.4 Determination of synchronous machine parameters 161

References 166

5 SYNCHRONOUS MACHINE REPRESENTATION IN STABILITY STUDIES 169

5.1 Simplifications essential for large-scale studies 169
5.1.1 Neglect of stator $p\psi$ terms 170
5.1.2 Neglecting the effect of speed variations on stator voltages 174
5.2 Simplified model with amortisseurs neglected 179
5.3 Constant flux linkage model 184
5.3.1 Classical model 184
5.3.2 Constant flux linkage model including the effects of subtransient circuits 188
5.3.3 Summary of simple models for different time frames 190
5.4 Reactive capability limits 191
5.4.1 Reactive capability curves 191
5.4.2 $V$ curves and compounding curves 196

References 198

6 AC TRANSMISSION 199

6.1 Transmission lines 200
6.1.1 Electrical characteristics 200
6.1.2 Performance equations 201
6.1.3 Natural or surge impedance loading 205
6.1.4 Equivalent circuit of a transmission line 206
6.1.5 Typical parameters 209

PART III SYSTEM STABILITY: physical aspects, analysis, and improvement

12 SMALL-SIGNAL STABILITY 699

12.1 Fundamental concepts of stability of dynamic systems 700
  12.1.1 State-space representation 700
  12.1.2 Stability of a dynamic system 702
  12.1.3 Linearization 703
  12.1.4 Analysis of stability 706

12.2 Eigenproperties of the state matrix 707
  12.2.1 Eigenvalues 707
  12.2.2 Eigenvectors 707
  12.2.3 Modal matrices 708
  12.2.4 Free motion of a dynamic system 709
  12.2.5 Mode shape, sensitivity, and participation factor 714
  12.2.6 Controllability and observability 716
  12.2.7 The concept of complex frequency 717
  12.2.8 Relationship between eigenproperties and transfer functions 719
  12.2.9 Computation of eigenvalues 726

12.3 Small-signal stability of a single-machine infinite bus system 727
  12.3.1 Generator represented by the classical model 728
  12.3.2 Effects of synchronous machine field circuit dynamics 737

12.4 Effects of excitation system 758

12.5 Power system stabilizer 766

12.6 System state matrix with amortisseurs 782

12.7 Small-signal stability of multimachine systems 792

12.8 Special techniques for analysis of very large systems 799

12.9 Characteristics of small-signal stability problems 817

13 TRANSIENT STABILITY 827

13.1 An elementary view of transient stability 827

13.2 Numerical integration methods 836
  13.2.1 Euler method 836
  13.2.2 Modified Euler method 838
  13.2.3 Runge-Kutta (R-K) methods 838
  13.2.4 Numerical stability of explicit integration methods 841
  13.2.5 Implicit integration methods 842
13.3 Simulation of power system dynamic response
  13.3.1 Structure of the power system model 848
  13.3.2 Synchronous machine representation 849
  13.3.3 Excitation system representation 855
  13.3.4 Transmission network and load representation 858
  13.3.5 Overall system equations 859
  13.3.6 Solution of overall system equations 861

13.4 Analysis of unbalanced faults
  13.4.1 Introduction to symmetrical components 872
  13.4.2 Sequence impedances of synchronous machines 877
  13.4.3 Sequence impedances of transmission lines 884
  13.4.4 Sequence impedances of transformers 884
  13.4.5 Simulation of different types of faults 885
  13.4.6 Representation of open-conductor conditions 898

13.5 Performance of protective relaying
  13.5.1 Transmission line protection 903
  13.5.2 Fault-clearing times 911
  13.5.3 Relaying quantities during swings 914
  13.5.4 Evaluation of distance relay performance during swings 919
  13.5.5 Prevention of tripping during transient conditions 920
  13.5.6 Automatic line reclosing 922
  13.5.7 Generator out-of-step protection 923
  13.5.8 Loss-of-excitation protection 927

13.6 Case study of transient stability of a large system 934

13.7 Direct method of transient stability analysis
  13.7.1 Description of the transient energy function approach 941
  13.7.2 Analysis of practical power systems 945
  13.7.3 Limitations of the direct methods 954
