Gas Chromatography
A Practical Approach

Edited by
P. J. BAUGH

Department of Chemistry and Applied Chemistry
University of Salford
The Crescent, Salford

Contents

List of contributors xvii
Abbreviations xix

1. Introduction to the theory of chromatographic separations with reference to gas chromatography 1
   Keith D. Bartle
   1. Introduction and history of GC 1
   2. The GC chromatogram 4
   3. Resolution in GC 5
   4. Band broadening in GC 6
   5. GC columns 7
   6. Speed of GC analysis 8
   7. Retention in GC 10
      Effect of temperature 10
      Temperature programming 10
      Dependence of retention on solute properties in GC 12
      Retention indices 12
   References 13

2. Gas chromatography instrumentation, operation, and experimental considerations 15
   Andrew Tipler
   1. Introduction 15
   2. Instrumental components and function 15
      Fundamental components 15
      The chromatographic oven 16
      Pneumatics 17
      Sample introduction 20
      Gas chromatographic detectors 31
   3. Operation and experimental considerations 38
      Where to start 39
3. Development, technology, and utilization of capillary columns for gas chromatography

Peter A. Dawes

1. Introduction
2. Types of capillary column
3. Evolution of the modern capillary column
   Column support material
   Stationary phase criteria and development
   Types of stationary phase for partitioning
   Manufacturing methods
4. Column performance evaluation
   Resolving power
   Determination of efficiency and performance parameters
   Kövats' retention index
   Speed of analysis
   Sample capacity
   Inertness
   Bleed
5. Column selection
   Stationary phase
   Internal diameter
   Film thickness
   Length
6. Care of a capillary column
   Protection of fused silica fabric and installation hints
   Column contamination
   Column operation

Contents

4. Derivatization reactions involving one reagent 137
   Silylation reactions 137
   Acylation reactions 141
   Alkylation reactions 145
   Condensation reactions 150
   Derivatives of miscellaneous types 152

5. Mixed derivatives 154
   Silyl-acyl and silyl-carbamate derivatives 154
   Acyl/acyl derivatives 156
   Acyl/alkyl derivatives 157
   Acyl/amide derivatives 158
   Silyl/alkyl oxime and acyl/oxime derivatives 159
   Derivatization procedures for prostaglandins 161

6. Bifunctional and mixed bifunctional monofunctional derivatives 162
   Bifunctional silylating agents 163
   Aldehydes and ketones as bifunctional derivatizing agents 163
   Alkyl boronates as bifunctional derivatizing agents 164

7. Derivatives used for separation of enantiomers 166
   Acylation with chiral reagents 166
   Chiral alkylating reagents 168
   Formation of diastereomeric amides 168

References 169

6. Gas chromatography in analytical toxicology: principles and practice 171
   Robert J. Flanagan

1. Introduction 171

2. Use of GC in analytical toxicology 172
   Sample collection and storage 172
   Sample preparation 173
   Columns and column packings 181
   Detectors 186
   General considerations 188

3. Applications of GC in analytical toxicology 192
   Screening for unknowns 193
   Drugs 194
   Pesticides 200
   Gases, solvents, and other poisons 202

4. Conclusions 206

Acknowledgements 208

References 208
Contents

7. Gas chromatography in clinical chemistry 213
   Jagadish Chakraborty
   1. Introduction 213
   2. Applications of GC 214
      Organic volatiles 214
      Organic acids 219
      Cholesterol and related compounds 226
      Amines and related compounds 229
      Polyols and sugars 232
   3. Conclusions 235
   References 235

8. Chiral separations by gas chromatography 237
   David R. Taylor
   1. Introduction 237
      Terminology and definitions 238
   2. Role of derivatization in chiral separations by GC 240
      Typical protocols for diastereoisomeric derivatization 243
   3. GC on chiral stationary phases (CSP) 245
      Phases based on monomeric peptides 247
      Phases based on polymeric amides 252
      Chiral GC using metal complexation 260
      Inclusion phases for chiral GC 269
   4. Applications of chiral stationary phases in GC 277
   5. Conclusions and future prospects 278
   References 278

9. Environmental analysis using gas chromatography 283
   Gerry A. Best and J. Paul Dawson
   1. Introduction 283
      Pathways to the environment 283
      Instrumentation 285
   2. The need for GC analysis of environmental samples 285
      Pollution problems 285
      Statutory regulations 285
   3. Analytical quality control of GC data 286
   4. Isolation of target compounds from the sample matrix 289
   xiii
Contents

Contamination 290
Procedure for the extraction of organochlorine compounds and PCBs from water 291
Procedure for the extraction of organochlorine compounds from samples of effluent 293
Extraction of organochlorine compounds from sediment samples 295
Extraction of organochlorine compounds from tissue samples 297

5. Clean-up procedures 297
Clean-up and separation of extracts using alumina and silica columns 298
Modified method for clean-up and separation using alumina/silica nitrate and silica gel 300
Clean-up and separation of extracts using solid-phase extraction (SPE) cartridges 303
Extraction of semi-volatile compounds from water samples using extraction discs 304

6. Analysis of pentachlorophenol 306

7. Determination of non-persistent pesticides present in water samples 307
Extraction and determination of organophosphorus and organonitrogen compounds in water 308
Extraction and clean-up of permethrin from water samples 310
Extraction and determination of phenoxyacetic acid type of herbicides 311

8. GC separation and quantification of target compounds 313
Choice of column 313
Calculation of concentration in samples using the internal standard method 315
Typical GC chromatograms for target compound analysis 315

9. Sampling and analysis of gases and vapours 316
Sampling 316
Desorption of components 322

10. Determination of types of oil in pollution samples 323
Oil fingerprinting 323
Oil fingerprinting—GC operating conditions 326

References 327

10. The role of gas chromatography in petroleum exploration 331
Gareth E. Harriman

1. Introduction 331
2. Composition of crude oils and source rock extracts 332
## Contents

3. Whole oil GC .................................................. 333
4. GC analysis of fractions isolated from crude oils and source rock extracts ............................................. 337
5. GC–MS analysis of fractions isolated from crude oils and source rock extracts ................................. 343
6. Conclusions ..................................................... 354
References ...................................................... 356

### 11. Combined gas chromatography–mass spectrometry

*Richard P. Evershed*

1. General considerations ..................................... 359
2. GC–MS instrumentation ...................................... 360
   - Use of packed columns ................................ 360
   - Use of capillary columns .............................. 360
   - Ion sources ............................................. 362
   - Use of different mass analysers ....................... 364
   - Ion detection ......................................... 367
   - Data collection and interpretation ................. 368
3. Applications .................................................. 368
   - Mixture analysis ...................................... 368
   - Trace analysis ....................................... 381
References ...................................................... 390

### Appendices

#### A1 Combined gas chromatography–Fourier transform infrared spectroscopy

*Peter Jackson*

1. Introduction .................................................. 393
2. Techniques description .................................... 395
   - Lightpipe GC–FTIR .................................. 395
   - Low-temperature matrix isolation GC–FTIR ........ 395
   - Low-temperature solid sample deposition GC–FTIR 397
3. GC–FTIR sensitivity ......................................... 398
4. GC–FTIR resolution ......................................... 399
5. GC–FTIR spectra ............................................ 402
6. Quantitative GC–FTIR ....................................... 404
7. Multiple detector systems ................................... 406

xv
Contents

8. GC–FTIR applications 406
   Industrial applications: commercial alcohols 407
   Advanced sampling techniques 408
   Pesticides analysis 410

9. Summary 411
   Acknowledgements 413
   References 413

A2 Suppliers of specialist items 415
