HANDBOOK OF CRYSTAL GROWTH 1

FUNDAMENTALS

Part A: Thermodynamics and Kinetics

Edited by
D.T.J. Hurle

H.H. Wills Physics Laboratory
University of Bristol
Bristol, UK BS8 1TL

1993
NORTH-HOLLAND
Amsterdam – London – New York – Tokyo
CONTENTS OF VOLUME 1

Preface ix
Foreword xi
Sir Charles Frank

Part A. Thermodynamics and Kinetics
1. Historical introduction 1
   H.J. Scheel
2. Phase equilibria 43
   R.F. Brebrick
3. Defect thermodynamics and phase diagrams in compound crystal growth processes 103
   H. Wenzl, W.A. Oates and K. Mika
4. Nucleation theory 187
   B. Mutaftschiev
5. The structure of supersaturated solutions 249
   A.S. Myerson and A.F. Izmailov
6. Crystal growth mechanisms 307
   J.P. van der Eerden
7. Growth and morphology of crystals: Integration of theories of roughening and Hartman–Perdok theory 477
   P. Bennema
8. Atomic-scale models of crystal growth 583
   G.H. Gilmer
9. Low-energy ion/surface interactions during crystal growth from the vapor phase: Effects on nucleation and growth, defect creation and annihilation, microstructure evolution and synthesis of metastable phases 639
   J.E. Greene

Part B. Transport and Stability
10. Description of transport processes 683
    A.A. Wheeler
11. Bulk models of solidification 741
    H.E. Huppert
12. Morphological stability 785
    S.R. Coriell and G.B. McFadden
13. Effects of flow on morphological stability 859
    S.H. Davis
14. Pattern formation in crystal growth ............................................. 899  
   B. Billia and R. Trevedi

15. The dendrite ................................................................. 1075  
   M.E. Glicksman and S.P. Marsh

16. Kinetics of electrocrystallisation ........................................ 1123  
   P. Ramasamy

Subject Index ............................................................................. 1207
