Fundamentals of Preparative and Nonlinear Chromatography

Georges Guiochon
University of Tennessee
and
Oak Ridge National Laboratory Distinguished Scientist
Knoxville, Tennessee

Sadroddin Golshan Shirazi
Senior Scientist
Applied Analytical Industries
Wilmington, North Carolina

Anita M. Katti
Senior Development Engineer
Mallinckrodt Chemical Inc.
St. Louis, Missouri

Academic Press
Boston San Diego New York
London Sydney Tokyo Toronto
# TABLE OF CONTENTS

Preface ................................................................. xiii

Acknowledgments ......................................................... xv

Chapter I. Introduction, Definitions, Goal ........................................ 1
   Introduction .......................................................... 1
   I. History of Chromatography ........................................ 3
      1. Discovery by Tswett and Early Works ......................... 3
      2. The Manhattan Project and the Purification of Rare Earth Elements .......... 4
      3. The API Project and the Extraction of Purified Hydrocarbons from Crude Oils .......... 6
      4. Preparative Chromatography as a Separation Process .......... 6
   II. Definitions ....................................................... 14
      1. Linear and Nonlinear Chromatography ......................... 14
      2. Ideal and Nonideal Chromatography ......................... 15
      3. Separation, Extraction, and Purification ................... 15
      4. The Various Scales of Preparative Chromatography .......... 16
   III. Goal of the Book ................................................ 17
   References ........................................................... 18

Chapter II. The Mass Balance Equation of Chromatography and Its Properties ........................................ 21
   Introduction .......................................................... 21
   I. The Mass and Heat Balance Equations of Chromatography ............ 22
      2. Discussion of the Fundamental Assumptions ................... 25
      3. Relationship between the Concentrations in the Stationary and Mobile Phases .......... 27
      4. Near-Isothermal and Nonisothermal Systems .................... 29
      5. Initial and Boundary Conditions .............................. 30
   II. Solution of the System of Mass Balance Equations ................. 33
      1. The Ideal Model .................................................. 36
      2. The Equilibrium–Dispersive Model ............................ 38
      3. The Lumped Kinetic Models .................................... 41
   References ........................................................... 47

Chapter III. Single-Component Equilibrium Isotherms ........................................ 49
   Introduction ........................................................... 49
   I. Fundamentals of Adsorption Equilibria ........................................ 51
      1. Basic Thermodynamics of Adsorption and the Gibbs Isotherm .......... 53
      2. The Linear Isotherm ............................................. 54
      3. The Langmuir Isotherm in Gas–Solid Equilibria ............... 55
      4. The Virial Isotherm ............................................. 56
      5. Statistical Thermodynamics of Adsorption ............................. 57
      6. Liquid–Solid Equilibria ......................................... 59
      7. Surface Excess and Excess Isotherms ............................. 60
   II. Models of Adsorption Isotherms ..................................... 61
      1. The Langmuir Isotherm in Liquid–Solid Equilibria ............... 61
### Chapter IV. Competitive Equilibrium Isotherms

**Introduction**

<table>

Table of Contents

2. The Martin and Synge Plate Model .................................................. 172
3. The Craig Plate Model ................................................................. 174
4. Comparison of the Two Plate Models ............................................... 176
II. The Solution of the Mass Balance Equation ..................................... 178
1. The Equilibrium-Dispersive Model ................................................ 179
2. Solution of the Lumped Kinetic Model .......................................... 184
3. From the Lumped Kinetic Model back to the Equilibrium-Dispersive Model . 189
III. The General Rate Model of Chromatography .................................... 189
1. Analytical Solution in a Particular Case ........................................ 192
2. Inverse Laplace Transform of the Solution ..................................... 195
3. Moment Analysis and Plate Height Equations .................................. 197
4. The Golay Plate Height Equation ................................................... 203
5. Dispersion and Partitioning in Short Coated Tubes ............................ 204
IV. The Statistical Approach .............................................................. 205
1. Transport Equation in Chromatography with a Finite Speed of Signal Propagation. 206
V. Sources of Band Asymmetry and Tailing in Linear Chromatography ...... 207
VI. Extension of Linear Chromatography Models to Nonlinear Chromatography . 213
References ......................................................................................... 215

Chapter VII. The Ideal Model of Chromatography
I. Elution of Single-Component Bands ................................................. 217
Introduction ....................................................................................... 217
I. Retrospective of the Solution of the Ideal Model .............................. 218
II. Migration and Evolution of the Band Profile .................................... 221
1. Continuous Part or Diffuse Boundary of the Profile ......................... 221
2. Origin of the Concentration Shock .................................................. 224
3. Propagation of Concentration Shock ................................................ 226
III. Analytical Solution of the Ideal Model ............................................ 229
1. General Closed-Form Solution ....................................................... 229
2. Case of the Langmuir Isotherm ....................................................... 230
3. Concentration Profile along the Column ......................................... 233
4. Case of the Bi-Langmuir Isotherm .................................................... 234
5. Case of the Freundlich Isotherm ...................................................... 237
6. Asymptotic Solution ........................................................................ 240
IV. Practical Relevance of the Results of the Ideal Model ..................... 241
References ......................................................................................... 243

Chapter VIII. The Ideal Model of Chromatography
II. Elution of Two-Component Bands .................................................... 245
Introduction: Retrospective .............................................................. 245
I. General Principle of the Solution ...................................................... 248
1. Statement of the Problem and Its Constraints ................................. 248
II. Analytical Solution for a Wide Band with Competitive Langmuir Isotherms . 254
1. Position of the Two Concentration Shocks ....................................... 254
2. Rear Diffuse Profiles of the Two Components .................................. 257
3. The Intermediate Plateau on the Rear Diffuse Profile of the Second Component . 258
III. Analytical Solution for a Narrow Band with Competitive Langmuir Isotherms . 260
1. Retention Time of the Second Concentration Shock ...................... 262
2. Maximum Concentration of the Two Components in the Mixed Zone .... 263
3. Elution Profile of the First Component between the Two Shocks ........ 264
4. Retention Time of the First Shock ................................................... 265
IV. Method of Calculation of the Solution of the Ideal Model in a Specific Case . 266
1. Case 1: Wide Injection ................................................................. 267
2. Case 2: Injection Plateau Eroded, Pure First Component Plateau Present .... 268
3. Case 3: Narrow Injection and Mixed Zone ...................................... 269
4. Case 4: Touching Bands, Second Component Plateau Present ............ 270
5. Case 5: Resolved Bands ............................................................... 272
6. Influence of the Width of the Injection Pulse .................................. 273
V. Dimensionless Plot of a Two-Component Band System .................... 276
VI. The Displacement Effect ............................................................... 276
Chapter IX. The Ideal Model of Chromatography

III. Displacement Chromatography

Introduction ........................................ 299
I. Steady State in the Displacement Mode. The Isotachic Train 301
  1. The Operating Line .................................. 303
  2. Influence of the Displacer Concentration .......... 306
  3. The Watershed Point ................................ 307
  4. Case of a Trace Component .......................... 308
II. The Theory of Characteristics ....................... 308
  1. Determination of the Characteristic Parameters 309
  2. Application to Displacement Chromatography ...... 312
  3. Wave Interactions .................................. 313
  4. Critical Value of the Displacer Concentration .... 316
  5. Plateau Concentrations and Bandwidth ............. 317
  6. Critical Column Length for Isotachic Train Formation 321
III. Practical Relevance of the Results of the Ideal Model 321
References ............................................. 322

Chapter X. The Equilibrium–Dispersive Model

I. Elution of Single-Component Bands .................. 325
Introduction ........................................ 325
I. Fundamental Basis of the Model and Apparent Dispersion Coefficient 327
II. Approximate Analytical Solutions ................... 331
  1. The Houghton Solution ............................... 331
  2. The Haarhoff–Van der Linde Solution ............... 333
  3. Range of Validity of the Haarhoff–Van der Linde and Houghton Equations 335
  4. Influence of the Sample Size on the Bandwidth .... 337
  5. Comparison of the Experimental Band Profiles and the Prediction of These Equations 341
III. Numerical Solutions of the Equilibrium–Dispersive Model 342
  1. Principle of the Finite Difference Methods ........ 344
  2. Estimation of the Numerical Errors Made during the Calculation 346
  3. First Method: Calculation of Numerical Solutions of the Mass Balance Equation 347
  5. Application of the Second Method ................... 351
  6. Finite Element Method ................................ 357
IV. Results Obtained with the Equilibrium–Dispersive Model 361
  1. Comparison of Solutions of the Ideal and the Equilibrium–Dispersive Models 361
  2. Comparison of the Results of Different Calculation Methods 364
  3. Results of Computer Experiments .................... 368
  4. Comparison with Experimental Results .............. 371
References ............................................. 378

Chapter XI. The Equilibrium–Dispersive Model

II. Isocratic Separations of Two-Component Bands and Gradient Elution 381
Introduction ........................................ 381
I. Numerical Analysis of the Equilibrium–Dispersive Model 382
  1. Finite Difference Methods. Principle .............. 384
  2. Finite Difference Methods. Errors in the Case of Two Components 384
  3. Finite Element Method ................................ 390
II. Gradient Elution .................................... 393
  1. Solution of the Ideal Model in Gradient Elution 395
  2. Representation of the Isotherm in Gradient Elution 395
# Table of Contents

3. Retention of the Modifier ....................................................... 397
4. Calculation of Elution Band Profiles ........................................ 398

III. Applications of the Equilibrium–Dispersive Model ......................... 401
1. Comparison of Solutions of the Ideal and the Equilibrium–Dispersive Models .... 401
2. The Hodograph Transform and Its Application ................................ 403
3. Results of Computer Experiments ............................................ 403
4. Calculation of Multicomponent Chromatograms .............................. 415
5. Comparison of Calculated Band Profiles and Experimental Results .......... 417
6. Experimental and Calculated Band Profiles in Gradient Elution .............. 429

References ................................................................................. 432

Chapter XII. The Equilibrium–Dispersive Model
III. Frontal Analysis and Displacement .............................................. 435

Introduction ............................................................................. 435

I. Displacement Chromatography with a Nonideal Column ...................... 436
1. Influence of the HETP ............................................................ 438
2. Influence of the Sample Size and the Displacer Concentration ................ 438
3. Influence of the Column Length ............................................. 442
4. Influence of the Separation Factor .......................................... 444
5. Case of Trace Components .................................................... 447
7. Case of Selectivity Reversal ................................................... 452

II. Applications of Displacement Chromatography .................................. 454
1. Separation of Rare Earths and Other Cations .................................. 456
2. Separation of Organic Compounds ............................................ 457
3. Separation of Peptides and Proteins ......................................... 459
4. Separation of Nucleic Acid Constituents ..................................... 464

III. Comparison of Calculated and Experimental Results ........................... 467

References ................................................................................. 471

Chapter XIII. The Equilibrium–Dispersive Model
IV. System Peaks in Chromatography ................................................. 473

Introduction ............................................................................. 473

I. System Peaks in Linear Chromatography ......................................... 475
1. General Experimental Results on System Peaks ............................... 475
2. Theory of System Peaks ........................................................ 478
3. Indirect Detection Using System Peaks ....................................... 487
4. Application of System Peaks to Analyte Peak Compression ................. 491
5. Vacancy Chromatography ....................................................... 492

II. High-Concentration System Peaks ............................................... 496
1. High-Concentration System Peaks for a Single-Component Sample .......... 497
2. High-Concentration System Peaks for a Two-Component Sample .......... 507

References ................................................................................. 515

Chapter XIV. The Kinetic Models
I. Frontal Analysis and Elution of Single-Component Bands ...................... 519

Introduction ............................................................................. 519

I. Solution of the Breakthrough Curve under Constant Pattern Condition ....... 521
1. Analytical Solution for the Constant Pattern Profile ............................ 522
2. Numerical Solution of the Breakthrough Curve under Constant Pattern Behavior .... 525
3. Effect of Axial Dispersion ................................................................ 526
4. The Shock Layer Theory ................................................................ 526
5. Shock Layer in the Case of the Langmuir Isotherm ............................. 530
6. Properties of the Shock Layer Thickness in Frontal Analysis ................. 531
7. Range of Validity of the Equilibrium–Dispersive Model .......................... 537

II. Analytical Solution of the Reaction–Kinetic Model ............................... 539
1. Solution of the Reaction–Kinetic Model in the Case of a Step Injection ...... 539
2. Numerical Solutions of the Kinetic Model for a Breakthrough Curve ......... 540
3. Analytical Solution of the Reaction–Kinetic Model in the Case of a Pulse Injection .... 541
4. Numerical Solution of the Reaction–Dispersive Model for a Pulse Injection .... 543

References ................................................................................. 544
