3.6. Miscellaneous results and problems ........................................... 112

4. The Divisor of a Graph ............................................................... 116
4.1. The divisor concept .................................................................... 116
4.2. Divisor and cover ...................................................................... 117
4.3. A generalization of the divisor concept ....................................... 118
4.4. Symmetry properties and divisors of graphs ............................... 118
4.5. The fundamental lemma connecting the divisor and the spectrum ... 121
4.6. The divisor – an effective tool for factoring the characteristic polynomial . 125
4.7. The divisor – a mediator between structure and spectrum ............ 128
4.8. Miscellaneous results and problems ........................................... 131

5. The Spectrum and the Group of Automorphisms ............................ 134
5.1. Symmetry and simple eigenvalues ............................................. 134
5.2. The spectrum and representations of the automorphism group .... 141
5.3. The front divisor induced by a subgroup of the automorphism group 149
5.4. Cospectral graphs with prescribed (distinct) automorphism groups 153
5.5. Miscellaneous results and problems ........................................... 153

6.1. Some families of non-isomorphic cospectral graphs ..................... 156
6.2. The characterization of a graph by its spectrum ......................... 161
6.3. The characterization and other spectral properties of line graphs .... 168
6.4. Metrically regular graphs ......................................................... 178
6.5. The (−1, 1, 0)-adjacency matrix and Seidel switching ................ 183
6.6. Miscellaneous results and problems ........................................... 185

7. Spectral Techniques in Graph Theory and Combinatorics ............... 189
7.1. The existence and the non-existence of certain combinatorial objects 189
7.2. Strongly regular graphs and distance-transitive graphs ................ 193
7.3. Equiangular lines and two-graphs ............................................ 199
7.4. Connectedness and bipartiteness of certain graph products ........ 203
7.5. Determination of the number of walks ..................................... 209
7.6. Determination of the number of spanning trees .......................... 217
7.7. External problems ..................................................................... 221
7.8. Miscellaneous results and problems ........................................... 223

8. Applications in Chemistry and Physics ........................................ 228
8.1. Hückel's theory ......................................................................... 228
8.2. Graphs related to benzenoid hydrocarbons ............................... 239
8.3. The dimer problem .................................................................... 245
8.4. Vibration of a membrane ......................................................... 252
8.5. Miscellaneous results and problems ........................................... 258

9. Some Additional Results ............................................................... 260
9.1. Eigenvalues and imbeddings ..................................................... 260
9.2. The distance polynomial ........................................................... 263
9.3. The algebraic connectivity of a graph ........................................... 265
9.4. Integral graphs ................................................................. 266
9.5. Some problems ................................................................. 266

Appendix. Tables of Graph Spectra ................................................. 268

Bibliography ................................................................................. 324

Index of Symbols ........................................................................... 360

Index of Names ............................................................................... 361

Subject Index .................................................................................. 364

Appendix A. Comments on the First Two Editions of the Book ............ 369

Appendix B. Recent Developments in the Theory of Graph Spectra .......... 373

B.1 A survey of relevant books ......................................................... 373
B.2 Expository papers ....................................................................... 376
B.3 Graphs with least eigenvalue −2 ............................................... 378
B.4 Largest eigenvalue ..................................................................... 381
B.5 Second largest eigenvalue .......................................................... 392
B.6 Distance-regular graphs ............................................................. 394
B.6.1 Strongly regular graphs .......................................................... 395
B.6.2 Other distance-regular graphs ............................................... 396
B.7 Graph angles and star partitions ................................................ 396
B.7.1 Examples and introducing comments .................................... 397
B.7.2 Some properties of graph angles ............................................ 399
B.7.3 Main angles ............................................................................ 402
B.7.4 EA-reconstruction of trees ..................................................... 404
B.7.5 Ulam's reconstruction conjecture for graphs ......................... 405
B.7.6 Star partitions and canonical star bases ................................. 407
B.8 Graph Laplacians ..................................................................... 409
B.9 Tables of graph spectra ............................................................. 411
B.10 The expert system GRAPH and the computer program GRAFFITI ... 413
B.10.1 System GRAPH .................................................................... 414
B.10.2 Program GRAFFITI .............................................................. 416
B.11 Graph spectra and combinatorial optimization ............................ 417
B.12 Miscellaneous results ............................................................... 418

Additional Bibliography .................................................................. 427
